ROYAL COMMISSION ON BANKING

AND FINANCE

Hearings held at Toronto,
Ontario, on Friday
April 13th, 1962.

THE COMMISSION

The Honourable Dana Harris Porter
Chief Justice of Ontario
Toronto, Ontario - Chairman

Mr. W. Thomas Brown, M.B.E.
Investment Dealer
Vancouver, British Columbia

Mr. James Douglas Gibson, O.B.E.
Banker
Toronto, Ontario

Mr. Gordon L. Harrold
Agriculturalist
Calgary, Alberta

Mr. Paul H. Leman
Corporation Executive
Montreal, Quebec

Mr. John C. MacKeen
Corporation Executive
Halifax, Nova Scotia

Dr. W.A. Mackintosh
Vice-Chancellor
Queen's University
Kingston, Ontario

Mr. H.A. Hampson - Secretary

Mr. Gilles Mercure - Joint Secretary

Toronto, Ontario
Friday, 13th April, 1962.

THE CHAIRMAN: We will call the meeting to order. The first brief before us today is that of Gairdner & Company. Are you ready to proceed?

MR. KENNER: Yes we are.

SUBMISSION OF GAIRDNER & COMPANY
LIMITED

APPEARANCES

- | | |
|---------------|--------------------------------------------|
| Mr. A. Kenner | - Director and Institutional Sales Manager |
| Mr. W. Keyser | - Money Market Specialist |

MR. KENNER: My name is Kenner. It is a pleasure to be able to present this brief to the Royal Commission. It is in two parts, the first part on the secondary market and N.H.A. mortgage and the second part is on the short-term capital market.

I will speak on the N.H.A. section and my associate, Mr. Keyser, our money market specialist, will speak on the capital market section. Then, after a brief outline of our submission we are both willing and able to answer any questions on either section.

THE CHAIRMAN: Then, will you proceed.

MR. KENNER: Yes.

1 The first section is on the N.H.A. mortgage
2 market. Our proposal is that the offerings by
3 C.M.H.C. be continued and increased and that C.M.H.C.
4 would act in the same way in the mortgage market
5 as the Bank of Canada does in the government market
6 and that there be established banking arrangements
7 to facilitate dealers who hold positions in N.H.A.
8 mortgages and also streamline the administration
9 and transfers.

10 These two sections will enable the large
11 lenders who are not presently in the mortgage business
12 to enter that field and that to enable the small
13 investors to take a part in the financing of homes
14 in the country that C.M.H.C. issue debentures in
15 the same manner that the Federal National Mortgage
16 Association in the States offers debentures in small
17 denominations to the public. Then, this will tap
18 not only the large pension funds and large investors
19 but also the small investors.

20 At the present time in the field the
21 Central Mortgage has sold a total of \$60 million of
22 mortgages. To date this has not spread the mortgage
23 field very wide, that is, getting new investors into
24 it. It is estimated that probably only five or six
25 new investors who have never anything to do with
26 mortgages have bought any of these yet. Most of
27 them have been bought by people who were already
28 in the mortgage business or who had some family
29 relationship with an administrator or something
30 along that line.

1 Another of the ideas that we hoped this
2 brief would tend to improve is that it would make
3 one mortgage market in the country instead of
4 several. At the present time there is a variety
5 of prices for your N.H.A. mortgages even though
6 they are all government guaranteed. This is caused
7 by difficulty of administration in some centres
8 as opposed to others and also the procedure of
9 disclosure varies from province to province.

10 So in order to improve this situation
11 we think it would be desirable that the Bank Act
12 be changed so that the chartered banks would be
13 allowed to finance dealers' N.H.A. mortgage positions
14 in a manner similar to the way they finance other
15 government corporate bonds on call loans.

16 That briefly is our N.H.A. mortgage
17 submission.

18 THE CHAIRMAN: Had we better deal with that
19 before we proceed with the other part? We will deal
20 with that before we go on to the second branch of
21 your submission.

22 Questions?

23 COMMISSIONER GIBSON: Mr. Chairman, I
24 might ask a couple of general questions. If you
25 were to get a marketable instrument of the kind you
26 are talking about, where would the funds that you
27 would hope to gain access to come from? You
28 mentioned the possibility of selling to pension funds,
29 small investors. What would those people be providing
30 now that might be -- what would they be investing

1 in now that they might leave and turn to mortgages?
2 Do you see what I am getting at?

3 MR. KENNER: It is true, this does not
4 create any new source of savings. It is just trying
5 to improve what these pension funds can invest in
6 at the present time. There are several varieties
7 to the ones we have, these large pension funds of
8 municipal and provincial employees etc. At the
9 present time the acts governing the investments of
10 these pension funds in most provinces are limited
11 to exclude the N.H.A. mortgages. It is only in
12 Saskatchewan and Nova Scotia where these large
13 civil service pension funds have been allowed to
14 enter this. So the spread of this would allow these
15 people to gain a higher return on their pension fund
16 and so improve their pension. To date in every
17 variety of pension fund their investments have been
18 bonds of both varieties and some stocks. So this
19 would merely be a way of allowing them to increase
20 the return on their investment.

21 COMMISSIONER GIBSON: Yes, but thinking of
22 it from the government's point of view, is there
23 any value in it? If the result were to make these
24 much more marketable instruments or produce an
25 instrument based on N.H.A. mortgages more marketable
26 and if this meant that small investors who buy
27 savings bonds or perhaps municipals or provincials
28 were to buy these instead what would be the value
29 of this from the government's point of view?

30 MR. KEYSER: If I may add to what Mr. Kenner

1 has said already I think it is expected that a
2 more marketable mortgage instrument, whether it was
3 in the form of specifically assigned mortgages
4 themselves or in the form of debentures against
5 mortgages, a more marketable type of instrument would
6 probably attract additional amounts of capital from
7 those who already invest in mortgages because they
8 would no longer need to fear the risk of having
9 to re-sell and, furthermore, I think possibly some
10 corporate pension funds who may perhaps due to
11 lack of knowledge of this type of investment have not
12 been heretofore in them may be attracted by the
13 re-saleability of mortgages as we conceive it in
14 the brief.

15 COMMISSIONER GIBSON: But there is no
16 reason to believe it would increase savings in general.
17 It would give them another instrument compared with
18 other instruments available now.

19 MR. KENNER: Only to the extent that a
20 higher rate of interest would encourage people to
21 save.

22 THE CHAIRMAN: I am not quite sure how
23 you expressed it but you suggested that some
24 action should be taken similar to that which the
25 Bank of Canada takes with reference to securities
26 and apply the same sort of procedure to your type
27 of mortgage security.

28 MR. KENNER: Yes.

29 THE CHAIRMAN: Could you elaborate on
30 that? I am not quite clear as to exactly what your

1 suggestion is.

2 MR. KENNER: The idea there is that the
3 value of these mortgages to a great extent rests
4 in the residual value of the guarantee by the
5 government at the present time. This would tend
6 to make one N.H.A. mortgage about equal to another
7 one. This is not really so at the present time.
8 Mortgages located in large metropolitan areas will
9 pay a higher price than, say, mortgages in small
10 outlying areas and one of the reasons for this is
11 that on any mortgage you must administrate it and
12 see that the payments are kept up and so on and
13 there are more trust companies, banks, etc., able
14 to do this in the larger centres than the small
15 ones so it is more costly to administrate those
16 in smaller areas so they are worth less.

17 Now, the idea was that there should be
18 a change in the guarantee so that if foreclosure
19 is slow now at the present time you lose money but
20 change this so that the investor does not lose
21 any money and these things would tend to make one
22 mortgage the same as another mortgage. Also,
23 the administration, that Central Mortgage can
24 administer any mortgage and they would all be the
25 same. And then one mortgage away up in the north
26 of Edmonton or somewhere would be worth as much
27 as one in Toronto and that when you have these
28 mortgages one the same as the other if Central
29 Mortgage act as the bank and had more or less a
30 bid for mortgages and offerings again this would

1 be above and below the market and it would tend
2 to establish a value for mortgages and would tend
3 to make it easier for the middleman such as
4 the investment dealer to carry out the job as
5 the jobber in these mortgages again making it more
6 marketable.

7 COMMISSIONER BROWN: If this instrument
8 was created do you envisage what sort of differential
9 yield would you receive between the C.M.H.C. piece
10 of paper and C.N.R.'s for example?

11 MR. KENNER: You are speaking of the
12 C.M.H.C. if they issued debentures?

13 COMMISSIONER BROWN: If this piece of
14 paper is created which you are talking about
15 which is a bond of some kind ----

16 MR. KENNER: Yes, we had envisaged this
17 as to look after the investments of the small
18 investor. The large ones would continue to buy
19 straight mortgages but on those there is very
20 little differential at all. A Canada bond in the
21 long-term is selling at about 4.85 per cent and
22 a C.N.R. about 5. per cent and this C.M.H.C.
23 debenture would be almost about the same as the
24 C.N.R. bond.

25 COMMISSIONER BROWN: Then, why should
26 not the C.M.H.C. just issue guaranteed debentures
27 and have another piece of government paper?

28 MR. KENNER: If they did this, they
29 own \$1½ billion mortgages out of \$4½ billion at
30 the moment. This would provide the money for that

1 \$1½ billion but I think you would have about
2 \$3 billion mortgages owned by other large investors
3 and the idea is to make those more marketable so
4 that the large investors would buy the blocks
5 of mortgages themselves. The big people would
6 own the mortgages themselves and the C.M.H.C.
7 debentures would be for the smaller people. The
8 yield would be lower.

9 COMMISSIONER BROWN: Why should not the
10 government then issue additional bonds and advance
11 the money to the C.M.H.C.?

12 MR. KENNER: This could be done but
13 this would separate it out so that there would be
14 a more direct connection between what C.M.H.C.
15 does. That is the way the C.N.R. finance their
16 own obligations rather than the government doing
17 it for them.

18 COMMISSIONER GIBSON: I have the same
19 problem as Mr. Brown. It seems to me that the
20 mortgages are different in their essence and nature.
21 There is more work connected with mortgages than
22 with other types of securities. Why make them
23 into government paper? If you make them into
24 government paper why don't you do what he suggests
25 and have the government just borrow the money
26 in the first place? There are costs involved in
27 this and this is an additional cost for somebody.
28 Under your scheme, I take it, the additional cost
29 would fall on the government.

30 MR. KENNER: Well, this business of the

1 government issuing securities would only look
2 after the part that they own which is just about
3 a quarter of the total. There have been some
4 suggestions that large private mortgage companies
5 be established to buy these N.H.A. mortgages
6 from C.M.H.C. and in turn issue debentures
7 themselves to the public and we think it would
8 be better for C.M.H.C. to do that rather than to
9 go through some intermediary.

10 COMMISSIONER GIBSON: In this case, as
11 I understand it, the proposal is that some private
12 groups do this and bear the costs. In your
13 proposal you are really saying that the C.M.H.C.
14 or the government should bear the costs. Is that
15 not correct?

16 MR. KENNER: I would say profit as
17 well as cost.

18 COMMISSIONER GIBSON: It might be, or
19 take the risk?

20 MR. KENNER: Yes.

21 COMMISSIONER BROWN: But if they are
22 taking all the risk why shouldn't they have all
23 the profit?

24 MR. KENNER: If C.M.H.C. do it?

25 COMMISSIONER BROWN: Yes.

26 MR. KENNER: Then they should.

27 COMMISSIONER BROWN: Then why not just
28 issue government paper?

29 MR. KEYSER: In other words, whether
30 C.M.H.C. sells large blocks of N.H.A. mortgages or

1 whether they issue debentures and give their
2 own N.H.A. mortgages the point is here the C.M.H.C.
3 is liquidating some of the capital tied up in
4 mortgages that they have advanced in place of the
5 blending of C.M.H.C. in offering blocks of their
6 mortgages under the present system but this is
7 just one additional way by which they can realize
8 funds from the mortgages they hold and a way
9 in which they extend mortgage investment to everyone.

10 COMMISSIONER BROWN: I think our problem
11 is we do not see why the return to the investor
12 today is not more than on government bonds. The
13 government is taking all the risk and making
14 available all the facilities for transfer or
15 facilities for negotiability and why should they
16 treat it on a different basis from other government
17 bonds. In this case how does it attract the small
18 investor any more than the present government bonds?

19 MR. KENNER: If C.M.H.C. were to issue
20 debentures they would treat this item the same
21 as C.N.R.'s where another agency of the government
22 can either buy through this outlet that would be
23 like the C.N.R.'s. The government could finance
24 these total things through one person rather than
25 through a number of them.

26 COMMISSIONER MACKINTOSH: Can I interject
27 a question? Can you tell me roughly what the
28 yield is on United States F.N.M.A.'s?

29 MR. KENNER: About 4 per cent and
30 long-term United States government about 3.90, 3.95

1 which is slightly more than these but the tender
2 system that C.M.H.C. now has is really a beginning.
3 It is a way that is being used to make your mortgages
4 held by the big investors more marketable and
5 this is one way of obtaining the capital.

6 I do not think their purpose is really
7 to dis-invest of all the mortgages they own but
8 to broaden the market through making them marketable
9 and this we think should be continued with a
10 few little changes to help make it more marketable
11 and make it more possible for dealers who have a
12 position in it which they cannot at the present time.

13 COMMISSIONER MacKEEN: Mr. Kenner,
14 is it your idea that debentures would have the same
15 maturity dates as mortgages, say, a 30-year term,
16 25-year term, would it be a shorter term and be
17 renewed at some time?

18 MR. KENNER: It was our idea that the
19 N.H.A. mortgages could take longer when they are
20 going to mature since they can be bought up. Say
21 you had a number of issues of various terms, 15
22 years, 10 years, etc.,

23 COMMISSIONER MacKEEN: It might be
24 that the government would be able to make a loss or
25 profit on interest as compared with mortgages which
26 would be lodged in an account?

27 MR. KENNER: Yes, there would be some.
28 If you kept your maturity schedule such that you
29 did not extend your average term too long you would
30 be free of risk.

1 COMMISSIONER MacKEEN: Say you had a
2 30-year mortgage, that is what I am getting at,
3 and a 10-year debenture and that 10-year debenture
4 matured, it is not likely the rate would be the same?

5 MR. KENNER: No, it could be different.

6 COMMISSIONER MacKEEN: It might be
7 higher.

8 MR. KENNER: And it might be lower.

9 COMMISSIONER MacKEEN: And how would
10 those funds be divided if, say, the interest rate
11 was higher, how would the government arrange that?

12 MR. KENNER: There would be some risk.

13 COMMISSIONER MacKEEN: What are your
14 thoughts on that?

15 MR. KENNER: I suppose there would be
16 some risk but there would be other things. You would
17 always have some difference because at the present
18 time you are paying a rate of about 6 per cent and
19 you would be financing at 5 per cent so you would
20 be building up something.

1 COMMISSIONER LEMAN: I do not see in here
2 any suggestion that this could be broadened to the
3 whole mortgage market for existing houses instead of
4 just new houses. Why is that? Why do we think, be-
5 sides the idea of encouraging construction, why do
6 we think of helping new houses and the owners of new
7 housing under this superstructure of government
8 guarantee, etcetera, and let the fellow who owns a
9 mortgage on an old house fend for himself in the market.

10 MR. KENNER: I think that if the secondary
11 market in mortgages expands - at the moment N.H.A.
12 mortgages are the simpler thing than a conventional
13 mortgage because of the guarantee and so on, and
14 this is a beginning, but I think after the market
15 did get established in N.H.A. mortgages, then it
16 would be possible to branch out further into
17 conventional, so that maybe an individual needing
18 a mortgage on a house could come to the dealer and
19 get a reasonable amount and price, but this is
20 just an easy way of getting the thing established.

21 COMMISSIONER LEMAN: Yes, but would you
22 recommend that old conventional mortgages on old
23 houses be brought under this umbrella you want to
24 build?

25 MR. KENNER: No, not really at this point.
26 One thing, for a dealer or anybody to get into this
27 thing, you must keep your administration costs and
28 such low, and it would be difficult for a dealer to
29 go out and check all the individual properties.
30 He is pretty well relying on an underlying guarantee.

1 If you were into conventionals you would have to do
2 more checking and it would be more expensive, and
3 somebody has to pay for it, so this is a start
4 for the market.

5 COMMISSIONER GIBSON: Are you not
6 suggesting that the government should do all this
7 checking and servicing in your proposal, whereas
8 now it is spread around amongst existing agencies?
9 I mean, this is a sizeable additional cost that
10 you are proposing the government should take on.
11 You are suggesting they should do all the ser-
12 vicing of these mortgages.

13 MR. KENNER: They should be willing to
14 do it. This would make the transfer from one
15 owner to another one easier, if someone was
16 willing to do it at a price regardless of who
17 originated it.

18 COMMISSIONER GIBSON: But you can
19 usually find somebody to do the servicing now at
20 a price, can't you?

21 MR. KENNER: Yes.

22 COMMISSIONER GIBSON: In fact I think
23 there are a lot of people who are eager to do it
24 at a price.

25 MR. KENNER: But prices tend to vary.

26 COMMISSIONER GIBSON: Sure, but this is a
27 market. Doesn't this happen in any market?

28 MR. KENNER: Yes, it does, but it is
29 just the nature of the mortgages. If they are
30 especially these government guaranteed ones, we

1 are trying to think of some way that would tend to
2 make the mortgage trade on its value as a govern-
3 ment guarantee, and so that it would change in
4 price and such as the market generally, rather
5 than having some other factor such as administra-
6 tion and such enter into the picture and change it.

7 COMMISSIONER GIBSON: What puzzles me
8 is that in its nature a mortgage is not a govern-
9 ment security. It is something related to a
10 particular piece of property at a particular
11 place, and there are costs involved in handling
12 this sort of thing. You are in fact saying you
13 wanted to unify those costs so that they are all
14 the same, by having one organization take the
15 risk on the whole business, is that correct?

16 MR. KENNER: We would be willing to,
17 but it would still continue as now where most
18 of them are administered by others.

19 One of the problems that exists now,
20 most of the administration charges are half a
21 per cent on the outstanding balance. This is
22 fine at the beginning of the mortgage when the
23 outstanding balance is large but I would think
24 that when a mortgage gets close to being paid
25 off and the balance is small, this half per
26 cent that the administrator is getting is very
27 small. It might be difficult to find somebody
28 else to take this on, because the cost of the
29 administrator is pretty well fixed regardless of
30 the amount outstanding, and as they get older it

1 might become more difficult to get somebody to
2 administer them for virtually nothing.

3 In the blocks we have sold to date we
4 find in our attempts to interest new buyers, in-
5 vestors who have not previously had mortgage
6 blocks, it has been a very strong point in favour
7 of selling them to them that a central reliable
8 organization such as C.H.M.C. is willing to
9 stand by and service these mortgages in a reli-
10 able manner and at a reasonable cost.

11 If they were to retain the outside
12 servicing agents and then at a later date wished
13 to sell some of their mortgages, I think the
14 general feeling was that possibly this would
15 restrict the potential buyers to the degree that
16 the trust company or bank, whoever it may be
17 who was servicing the block, may not be an
18 acceptable servicing agency to a potential buyer
19 whereas Central Housing and Mortgage Corporation
20 would be undoubtedly acceptable as service agent.

21 So that having Central Mortgage and
22 Housing Corporation standing by willing to ser-
23 vice these mortgages blocks is essential to the
24 transferability of these mortgage blocks, if
25 we accept the secondary mortgage business as
26 being desirable, which I think Mr. Bates does
27 feel.

28 COMMISSIONER GIBSON: Now, in other
29 words, you are suggesting that these offerings
30 by C.M.H.C. of mortgages have not really been

1 successful, are you? Weren't they sold at fairly
2 good prices?

3 MR. KEYSER: This is not a reflection
4 on their success particularly. Rather we are in
5 the phase of developing the secondary market
6 when a great deal of education has to be done if
7 we are to attract new sources of funds in this
8 type of investment.

9 COMMISSIONER GIBSON: Yes, but they have
10 succeeded, I take it, certainly it is my impression,
11 in selling these mortgages, in somewhat improving
12 the prices in the three auctions, I think that
13 they have had.

14 MR. KEYSER: Four auctions. There has
15 been a very gratifying response particularly by
16 those tenderors who are used to buying them and
17 who are willing to lay in large quantities of
18 mortgages on simply one bid without having to
19 initially initiate mortgages on the books them-
20 selves. But we feel that there has been not a
21 great deal of success in finding new buyers.

22 COMMISSION MACKINTOSH: Have not the
23 original buyers redistributed a good deal?

24 MR. KEYSER: There has been a degree of
25 redistribution in this, purchasing them at tender
26 by these buyers who have not yet been buyers, but
27 of course I have not that absolute knowledge of
28 their success in redistributing mortgages, but I
29 take it there has been no more than perhaps five
30 or eight new buyers interested through the previous

1 four tenders.

2 MR. KENNER: In this past tender, the
3 fourth series, as far as we can see, there was
4 only, of the \$15 million sold, there was only ten
5 per cent of it that went to people who planned to
6 distribute it to other new investors, but the
7 rest was purchased by insurance companies either
8 for their own holdings or for some associated
9 company.

10 This last one was really so successful
11 that maybe the future ones should be bigger to
12 allow more people like ourselves, dealers, who
13 are interested in selling it to new people, to
14 get into it.

15 COMMISSIONER MACKINTOSH: I thought the
16 banks, trust companies are selling these blocks
17 of these mortgages.

18 MR. KENNER: Most definitely, most
19 of them again to the pension funds and such which
20 they administer. We are trying to broaden it
21 out so that if one trust company buys it and
22 they do not come to that close family relation-
23 ship, it spreads out to more as administrators.

24 COMMISSIONER MACKINTOSH: Do you suggest
25 that the buyers are hesitant because the block is
26 going to be administered by one of the banks, one
27 of the well known trust companies, that this is
28 not an acceptable administration?

29 MR. KEYSER: This undoubtedly is accept-
30 able administration, but I believe you have referred

1 to the comment I made earlier, and I think it is
2 even more acceptable that the agency that originated
3 the mortgages and who is currently administering
4 them, be permitted to continue to administer them,
5 and in this case it is Central Mortgage and
6 Housing Corporation.

7 COMMISSIONER MACKINTOSH: As I recall it,
8 when the banks were empowered to get into the
9 mortgage business, part of the attractiveness of
10 this was the very widespread branch system; and
11 the other side of the attractiveness was that it
12 would enable the C.M.H.C. to get out of a lot of
13 costly administration. As I understand your
14 proposition, you want to reverse this again and
15 put the C.M.H.C. back in and enlarge their area
16 of administration.

17 MR. KENNER: In effect this has already
18 been done. When Central Mortgage first entered
19 the direct lending field, they did, they made
20 their loans through other approved lenders and
21 had those banks and trust companies, insurance
22 companies administer it for them. It was later
23 as the volume of directing financing grew so much
24 that they set up their own administration nation-
25 wide, so they are the biggest administrators.

26 MR. KEYSER: My belief is Central Mort-
27 gage and Housing Corporation would like to see
28 additional private funds brought into this market
29 and they feel this might be done though the creation
30 of a secondary market in mortgages, and if the cost

1 of doing this is increasing the amount of ser-
2 vicing, then I think possibly this is the cost of
3 bringing in new private funds. Now, it might
4 possibly be done without the need to increase ser-
5 vicing.

6 COMMISSIONER MacKEEN: Have you formed
7 any estimate what the cost would be for servicing
8 such mortgages to the government?

9 MR. KENNER: As a rule the mortgage
10 charge would be about \$33 per mortgage per year,
11 about 35 cents on the yield, and presume it must
12 be close to that cost, giving a little profit,
13 but if you have a pension fund you will probably
14 want all of your mortgages, no matter where you
15 bought them, administered by one place, whether
16 it be trust company or bank, rather than having
17 to deal with many administrators. In your mort-
18 gage portfolio.

19 One of those people you might have is
20 Central Mortgage, and the idea here of having
21 them in it would tend to make everybody more
22 willing to do the same thing.

23 COMMISSIONER GIBSON: Is it not a fact
24 that most of the parcels of mortgages that are
25 sold now are sold with one bank or trust company
26 servicing them in a parcel and servicing the whole
27 parcel? I mean, I think this is the way that most
28 transactions occur today.

29 MR. KENNER: Yes,

30 COMMISSIONER GIBSON: There is no particular

1 difficulty about that, is there?

2 MR. KENNER: No, it is just that who-
3 ever bought the parcels at some time in the
4 future might wish to sell them and to rearrange
5 their portfolio, and they might be dealing
6 generally with a different trust company or bank
7 and would like the new one to take this administra-
8 tion over; and, as I mentioned, as the mortgages
9 get smaller and smaller, as they approach
10 maturity, when the present way is to charge a
11 percentage of the total, it is less attractive
12 for anybody else to do it.

13 COMMISSIONER GIBSON: Basically you
14 are saying you would like to have them get a
15 more standardized marketable instrument.

16 MR. KENNER: Yes.

17 COMMISSIONER GIBSON: Obviously if you
18 do that the yield runs under certain costs of
19 development.

20 MR. KENNER: If they became more market-
21 able, the rate the people would pay would go down,
22 the home owner would pay.

23 COMMISSIONER LEMAN: In suggesting that
24 this system of C.M.H.C. could not make a market
25 in this thing, there are more implications in
26 that, aren't there? Would you then suggest that
27 the C.M.H.C. should accept directives from the
28 Bank of Canada in this field?

29 MR. KENNER: Most definitely that it
30 should be centralized that way.

1 COMMISSIONER LEMAN: Would there be some
2 little bit of conflict of interest between the
3 aims of the Bank of Canada at a particular moment
4 and the objectives of the C.M.H.C. at that same
5 particular moment, due to an inventory position
6 they might have or something of the kind?

7 MR. KENNER: I do not see really much
8 change of conflict, that they should act basically
9 together anyway.

10 MR. KEYSER: In fact actually the Bank
11 of Canada activities in the market with the
12 support bid or with an offering, as the case may
13 be, would be to lend reassurance to the mortgage
14 market, but not specifically for the use of
15 control of money supply. It would not be an
16 instrument in that sense. In that way it would
17 not be up to the Bank of Canada's activities in
18 the book market operation.

19 COMMISSIONER BROWN: What if this
20 centralization of everything that you are en-
21 visaging and the inevitably lower yield resulted
22 because of a more marketable piece of paper,
23 would they then be as attractive to some of these
24 large buyers who like the yield but who are pre-
25 pared to take the risk because they have been wide-
26 spread?

27 MR. KENNER: I think it is quite possible,
28 as the yield of the N.H.A. went lower, as they be-
29 came more marketable, there are quite a few of
30 these insurance companies and such who are willing

1 to have unmarketable securities who would tend
2 to put more money into conventional securities and
3 less into these. N.H.A. being marketable, you
4 would bring more new people to replace the in-
5 surance companies for part of their investments.
6 The tendency would perhaps also be to reduce the
7 yield on conventional mortgages if more money was
8 willing to go into them.

9 COMMISSIONER BROWN: I do not see how
10 it is going to increase the amount of money or
11 savings overall that comes in into the mortgage
12 field.

13 MR. KENNER: Only that these were
14 marketable which might bring more people who did
15 not invest in mortgages, to invest in them.

16 COMMISSIONER MACKINTOSH: I would like
17 to ask you one other question for my own under-
18 standing. I do not understand how you can propose
19 a title transfer through a bank in the same way
20 as bonds, simply for the reason that the bond is
21 a standard instrument and a thousand dollar bond
22 is the same in Halifax as in Vancouver; but a
23 mortgage or parcel of mortgages is related to a
24 specific piece of property and if you sell one in
25 Vancouver and buy one in Halifax, well, one horse
26 is black and the other is white - they are not
27 interchangeable.

28 COMMISSIONER BROWN: Which is which?

29 THE CHAIRMAN: In addition to that, each
30 mortgage contains a covenant, and the covenant is

1 valuable according to the credit worthiness of
2 the man who signs it, each one is different.

3 MR. KENNER: We only envision this as
4 applying to blocks of mortgages that originate
5 with Central Mortgage and were administered by
6 Central Mortgage and that they would not be -
7 if a new owner bought it they would not be re-
8 registered in the new owner's name. There would
9 merely be a block transfer, with the ownership
10 in such resting with C.M.H.C. as agent; and it
11 is really who are they acting as agent for that
12 would change, but the blocks would have to stay
13 as blocks with C.M.H.C. being the administrator.

1 THE CHAIRMAN: It all depends on whether
2 the government would be prepared to enter into this
3 proposition and give the necessary guarantee.

4 MR. KEYSER: And whether one block is
5 black as opposed to another being whiter. Really,
6 the investor is interested in the quality of the
7 guarantee, and in this sense he is not inclined to treat
8 them all as equal.

9 COMMISSIONER MACKINTOSH: It is perfectly
10 easy if you just make the mortgage as represented
11 by a C.M.H.A. undertaking; in other words, you
12 really issue a less formal debenture to cover this
13 block of mortgages?

14 MR. KEYSER: Yes.

15 COMMISSIONER LEMAN: Eventually, when
16 there is default on a mortgage somebody has to go
17 through the process of foreclosing and collecting.
18 You are trying, in effect, to insulate the ultimate
19 lender from this whole process, are you not?

20 MR. KEYSER: Yes.

21 COMMISSIONER LEMAN: So that eventually
22 it is the government that would foreclose in all
23 cases?

24 MR. KENNER: Or it could be some approved
25 lender that does it. But at the present time he
26 is almost insulated in that he continues to get
27 his full rate of interest for six months, and if it
28 takes longer than that 2 per cent less than the
29 rate. So, you have almost insulated him but not
30 quite, and this again, since he is quite insulated,

1 you have to look at the underlying value, at
2 what are the chances of foreclosure on a particular
3 house -- which areas in the country are better
4 than others. So, just to go the other little bit
5 to completely insulate him ---

6 COMMISSIONER LEMAN: Would he also be
7 insulated against calling?

8 MR. KENNER: No, you can get paid off
9 before you expect it.

10 COMMISSIONER BROWN: How would you work
11 that? Say somebody has a thousand dollar --
12 a small investor has \$1,000 in C.M.H.C. debentures:
13 How does he get insulation?

14 MR. KENNER: There would be no insulation
15 if you were a large buyer of a block of mortgages --
16 a half a million or so. If you were a small
17 investor and bought a C.M.H.C. debenture, there
18 you have a fixed term bond and you are completely
19 insulated.

20 MR. KEYSER: If you were to buy a block
21 of mortgages and have some of them prepaid, this
22 problem would not differ greatly from the problem
23 of the large institutional investor purchasing
24 sinking fund debentures where the only difference
25 is in the case of sinking fund debentures he
26 can in various ways avoid the call, and the
27 difference is when one holds mortgages he cannot
28 avoid pre-payment of one or two; he cannot replace
29 them, of course.

30 COMMISSIONER LEMAN: Would you make these

1 debentures callable at par?

2 MR. KEYSER: The debentures we speak of
3 here for the small investor would not be callable
4 at all -- not necessarily. I am simply comparing
5 a block of 40 N.H.A. mortgages and the risk of one
6 or two being prepaid with any sinking fund debentures.

7 COMMISSIONER GIBSON: But these risks of
8 re-payment vary with the times, do they not? What
9 I mean, we have a certain structure of interest
10 rates now, and suppose five years from now we
11 had a considerably lower structure, the risk of
12 pre-payment would enter considerably then.

13 MR. KEYSER: There are two things that
14 protect the investor from pre-payment: First,
15 a N.H.A. mortgage cannot be pre-paid before three
16 years.

17 COMMISSIONER GIBSON: That is why I
18 said five years.

19 MR. KEYSER: That would remove that
20 clause. If the N.H.A. home owner would have by
21 that time had to accumulate one-third of his own
22 equity before he could re-finance it conventionally.
23 This would be done through a market increase in
24 the value of his property, but it is unlikely it
25 would be possible before 10 years if the mortgage
26 value of the property remained unchanged and his
27 additional equity was simply provided through
28 his monthly payments of interest and principal
29 on the mortgage.

30 COMMISSIONER GIBSON: This is true, but

1 you can have changes that decrease or increase the
2 chance of pre-payment, and these are not readily
3 predictable.

4 MR. KEYSER: This is quite correct. This
5 factor itself is not necessarily undesirable from
6 the standpoint of your question.

7 COMMISSIONER GIBSON: No, it could work
8 either way.

9 MR. KEYSER: Yes, it could.

10 THE CHAIRMAN: We will proceed to the
11 second branch of the submission: Short-term
12 capital market.

13 MR. KEYSER: Our presentation today on
14 the Canadian short-term capital market concerns
15 itself mainly with the job of corporate borrowers
16 seeking the cheapest possible temporary capital.
17 In so doing, the market is developed by short-term
18 promissory notes on major corporations. We note
19 briefly some problems that have arisen for borrowers
20 and for those who deal in borrowers' needs.

21 Basically, the problems are these -- and
22 I refer you to page 10 of our brief, section 4,
23 which is entitled, "The Market Has Provided Its
24 Own Solutions, But With Undesirable Consequences."
25 The progression of this has begun with the emergence
26 of agency agreements and has led to jobbers acting
27 as principal in buying a corporation's notes up
28 to an agreed upon maximum limit. In guaranteeing
29 to buy a corporation's notes within a specified
30 period of time, for instance, 48 hours, the jobber

1 has created a situation of a non-bank institution
2 granting lines of credit to corporate borrowers
3 against their fixed-term promissory notes. This
4 development is impeded by banks' refusals to
5 accept commercial paper for call loan purposes.
6 The jobber must then resort to non-bank sources
7 of loan funds.

8 The emergence of non-bank sources of
9 funds: Corporations with funds to invest for
10 short periods of time have recognized this need
11 of dealers to obtain loans secured by commercial
12 paper. Since banks refuse to grant such loans,
13 trust company and non-financial corporate sources
14 of funds have entered the market to fill the void
15 left by banks. However, it would be misleading
16 not to observe that if banks did advance loans
17 against commercial paper collateral, the rate would
18 likely be much higher than the yield of the
19 collateral and jobbers would seek to reduce carrying
20 cost by borrowing from non-bank sources when
21 cheaper. This situation would undoubtedly have
22 existed during 1961-1962 to the present, but not
23 during 1959-early 1960.

24 Furthermore, there has been an emergence
25 of non-bank, non-resident sources of funds for this
26 purpose. U.S. Commercial Banks have begun to
27 enter Canada as country bankers for earlier paper
28 inventory. Rates compare favourably with those
29 of domestic non-bank lenders and funds are more
30 reliable and sizeable. The exchange hedge is handled

1 by the lender. This leads us to the basic premise
2 on which this brief rests, one which we feel
3 sincerely to be valid, and that is, it is desirable
4 to manage credit -- "credit" here being used in the
5 sense of the liquidity of the economy -- and in
6 that context the developments I have just outlined,
7 we feel, are undesirable.

8 From early beginnings the banks have
9 traditionally fulfilled the borrowing needs of prime
10 corporations at prime rates. With the emergence
11 of a short-term capital market during the past seven
12 years competition for banks has developed in their
13 lending operation, since market money has generally
14 been readily available to prime corporations at
15 lower than prime rates. From this has grown the
16 gulf between banks and jobbers in performing a
17 fairly normal market function that is providing
18 capital capital at realistic market rates. We
19 suggest in brief that in future better jobber-bank
20 co-operation in this area could work to the benefit
21 of both banks and borrowers. The hypothetical
22 institution we refer to in our brief, which we
23 call the Merchant Bank, is simply an illustration
24 of functions that we feel are not being properly
25 performed but that are needed to develop a short-
26 term capital market. We do not suggest that machinery
27 for such an institution be necessarily considered
28 since we believe that bank-jobbers co-operation
29 could meet the problems in a very satisfactory
30 manner.

1 We would like to answer any questions
2 to elaborate on this.

3 COMMISSIONER BROWN: Would you care to
4 comment on the extent to which such commercial
5 paper issued by a corporation is part of its value
6 in the line of credit that corporation has with the
7 chartered bank?

8 MR. KEYSER: You are asking what
9 proportion of the corporation's short-term needs
10 are provided through the market?

11 COMMISSIONER BROWN: No. I am asking,
12 in evaluating the short-term needs that you are
13 negotiating from a corporation, to what extent is
14 the value of that based on that corporation's line
15 of credit with the chartered bank?

16 MR. KEYSER: Essentially, when a potential
17 borrower comes to us seeking our aid or assistance
18 in placing his promissory notes on the market, we
19 must satisfy ourselves that this corporation is a
20 good credit risk in a general sense, and part of
21 being a good credit risk is having good relations
22 with banks, naturally, and this is very important
23 in evaluating the rate at which his notes will be
24 sold on the market. But, of course, lines of credit
25 are fairly nebulous things: You cannot get a
26 statement from the bank to say your line of credit
27 is such and such. So, on that basis we cannot say,
28 "You can, therefore, issue notes up to this amount."

29 COMMISSIONER BROWN: No, but it is a
30 factor that has to be taken into consideration?

1 MR. KEYSER: It is a factor -- but it
2 is not a large factor with large companies, I might
3 add -- if you are dealing with a very large corporation
4 whose total short-term borrowings are relatively
5 small compared to its current assets, then ...

6 COMMISSIONER BROWN: It presumably has
7 a good line of credit with a chartered bank, anyway?

8 MR. KEYSER: I think so, yes..

9 COMMISSIONER BROWN: The point I am
10 making is that this paper only becomes available
11 because of the availability of credit?

12 MR. KEYSER: Right -- I am sorry:
13 Because of the willingness of other corporations
14 to rely on the credit ability of the borrower due
15 to size and the lender's knowledge of the corporation's
16 operation. I would not say, for instance, in
17 the case of the top dozen corporate borrowers today --
18 I would not think that these corporations' lines of
19 credit would be an essential consideration at all
20 in their ability to market paper at the rates they
21 are able to market them at.

22 COMMISSIONER BROWN: That is not a
23 direct evaluation. It certainly would be, of a
24 middle-sized corporation.

25 MR. KEYSER: Yes, when you get into
26 the marginal -- it does become relatively more
27 important.

28 MR. KENNER: When we speak of prime
29 borrowers we are speaking of a very small group
30 of companies. There are probably in the whole

1 country not many more than 50 which you could call
2 prime borrowers, and it is they who can and do
3 borrow most of the money, and the ones below that,
4 it is not really so much a matter of a little higher
5 rate; it is just that they don't have the market
6 as a place to borrow. So, these big ones -- people
7 when they buy the paper of the big companies do
8 not even enquire as to whether there is a line of
9 credit or how big it is with the company's bankers.

10 COMMISSIONER BROWN: The second question
11 is, is there anything that you see in the statutes
12 now that would prevent somebody setting up an
13 organization that could not be called a commercial
14 bank because of The Bank Act, and, if so, why
15 has it not been done? If nothing would prevent
16 the establishment of such an organization, why has
17 it not been done?

1 MR. KEYSER: The merchant bank, as we
2 conceive of it here, would be a fairly high grade
3 type of operation in that it would deal primarily
4 with deposits and pay interest on these and make
5 loans to other corporations against the security
6 of their promissory notes.

7 There are only currently two institutions
8 in Canada that could possibly fulfill this function.
9 One is the Chartered banks and the other is trust
10 companies. I suggest that certain capital require-
11 ments of the chartered banks for these purposes
12 are fairly large at this stage in the development
13 of the market and there are certain limitations on
14 trust company operations with respect to trans-
15 actions in promissory trading. From that point
16 I think these are essentially the restrictions
17 that have prevented this type of operation.

18 COMMISSIONER BROWN: Why could not
19 an entirely new company be set up to do this?

20 MR. KEYSER: A new company undoubtedly
21 would have to comply to certain regulations and
22 it should really be in the Bank Act, I would say.
23 There is no provision made at the present time
24 for this type of operation to be established.

25 COMMISSIONER BROWN: I am a little dis-
26 turbed that everything has to be incorporated
27 before it can be established. Why couldn't it
28 be established because of the exigencies of the
29 market?

30 MR. KEYSER: I think possibly the jobber

1 group in Canada is more likely aware of the emergence
2 of the short term capital market than perhaps other
3 institutions might be.

4 COMMISSIONER BROWN: I think the banks
5 are aware of it.

6 MR. KEYSER: Well, yes, in that it con-
7 flicts in a way with an established bank function
8 and that is the advancing of loans at prime rates
9 and in a sense for years this function has been
10 very, very well performed by the banks but we are
11 now coming to the point where large group lenders
12 with temporary cash balances are willing to lend
13 to other corporate organizations with capital
14 needs at rates that are considerably less than
15 prime rates and in fact I think we observe in
16 the report that the rate spread on average over
17 the past five years has been approximately one
18 and a half per cent.

19 THE CHAIRMAN: Do I understand that you
20 propose that some new institution should be set
21 up to handle this sort of business?

22 MR. KEYSER: Actually, no.

23 THE CHAIRMAN: A blending institution?

24 MR. KEYSER: There is a need for the
25 blending function in the market.

26 THE CHAIRMAN: I thought what you said
27 went further than that. Am I wrong?

28 MR. KEYSER: We feel that the merchant
29 bank is an illustration really of the need for the
30 performing of those functions or at least to

1 illustrate the fact that these functions are not
2 being performed. Frankly, I feel that if some-
3 thing could be done to fulfill this function
4 without resorting to a new type of institution
5 that it would be even more acceptable.

6 THE CHAIRMAN: Yes, you refer to the
7 merchant bank in the short term capital market and
8 then you go on to discuss what this institution
9 would be. I thought that institution was to solve
10 the problem. Is that right?

11 MR. KEYSER: The merchant bank is merely
12 one suggestion. We have heard just recently that
13 a couple of the banks are considering lending at
14 closer to market rates on promissory notes in the
15 way that they lend money on other kinds of
16 collateral. If this were to be the case then
17 the merchant bank or blending institution would
18 be unnecessary anymore.

19 MR. KENNER: This way jobber co-opera-
20 tion would fulfill the function.

21 THE CHAIRMAN: Well, what do you
22 suggest that this Commission should recommend
23 to solve the problem that you feel is a serious
24 one?

25 MR. KEYSER: We feel that the problem
26 could be solved if the banks would become willing
27 to accept short term promissory notes of large
28 corporations.

29 THE CHAIRMAN: Suppose they are not
30 willing to accept them?

1 MR. KEYSER: Then the alternative is
2 an institution that permits --

3 THE CHAIRMAN: Then why not go ahead and
4 form one? Who is to provide the institution -
5 the government or somebody else? If someone else
6 is to do it that is a matter that could be solved
7 if you could persuade somebody to do it.

8 MR. KENNER: Well, a study of the whole
9 thing that is going on because of your delibera-
10 tions will make it quite possible that some time
11 and thought will be given to it and that such an
12 institution -- that some of the interested parties
13 may try to establish such an institution them-
14 selves if we still have to live within the acts
15 that are there at the present time.

16 MR. KEYSER: To a degree jobbers have
17 begun this function by acting as principals in purchasing
18 short term promissory notes and financing them as
19 best they can with off street lenders but this in
20 itself creates certain problems that result in
21 pressure on market rates for their short term
22 loans.

23 COMMISSIONER GIBSON: To get some per-
24 spective on this question I think it would be
25 very helpful if you would give us your views on
26 how the short term money market has developed?
27 You have said earlier that there has been quite
28 a development in this market since 1954. Has it
29 been a growing, developing market over the eight
30 years or so since it started?

1 MR. KEYSER: The portion of the short
2 term market we refer to here -- and we will limit
3 this to the money market or short term market for
4 corporate borrowers and lenders to corporation --

5 COMMISSIONER GIBSON: Right.

6 MR. KEYSER: Back about 1955 or 1956
7 or perhaps even as late as 1957 there came a time
8 when large corporate investors became aware that
9 associate companies or companies with whom they
10 were fairly close needed temporary capital at
11 times that the lenders themselves were long
12 cash. The corporate lenders were able to put
13 their money to work in short term Government of
14 Canada obligations or other forms of deposits
15 at market rates. The corporate lenders, on the
16 other hand, were able to borrow temporarily that
17 additional at bank credit at fairly high rates
18 relative to the market.

19 Certain groups with whom we are familiar
20 did get together and did lend one to the other at
21 an advantage to both of them somewhere in between
22 market rates and bank prime rates and from this
23 time with the assistance of jobbers this market
24 has developed considerably.

25 COMMISSIONER GIBSON: And it has grown
26 to a considerable size?

27 MR. KEYSER: It is difficult to estimate
28 the amount of borrowing that is done by corpora-
29 tions in this country but I would suggest there
30 are 50 to 60 borrowers in Canada today who do this

1 and their total borrowing requirements over the
2 past two years or the past year or so would have
3 been approximately \$400 million.

4 COMMISSIONER GIBSON: How much do you
5 think would be in the market at any given time in
6 the way of paper, that is, in some recent time?

7 MR. KEYSER: At least half that amount.

8 COMMISSIONER GIBSON: Half of the \$400
9 million?

10 MR. KEYSER: Yes. Some of this you
11 see reflected in the off street loan figures
12 prepared by the Investment Dealers Association
13 and they, of course, through the recent survey
14 have figures which they have attached to their
15 brief which we do not have access to at this time.

16 COMMISSIONER GIBSON: Does most of this
17 business come through dealers or is some of it
18 done directly?

19 MR. KEYSER: I would say that almost
20 all of it goes through dealers.

21 COMMISSIONER GIBSON: There are very
22 few corporate treasurers who deal directly with
23 each other?

24 MR. KEYSER: Well, it is more convenient
25 for the lender to go through a dealer because he
26 can then no longer be accused perhaps of something
27 less than an arm's length transaction and, further-
28 more, the lender now has a much wider choice of
29 promissory paper and rates do vary from day to
30 day and hour to hour and the dealer is a

1 professional bringing a lender together with a
2 borrower and to some extent the lender may have
3 funds to invest for 30 days whereas the borrower
4 may not want to borrow for that length of time.
5 So that the jobber performs this blending function
6 that is referred to here.

7 COMMISSIONER GIBSON: Would you say
8 something about the degree of sensitivity of this
9 short term corporate paper in regard to monetary
10 conditions?

11 MR. KEYSER: Over the past five years
12 it would appear that there have been ample -- with
13 one exception, 1959 and early 1960 -- there have
14 been adequate funds to support the borrowing re-
15 quirements of the very prime corporate borrowers
16 aside from the finance companies and at many
17 times during that five year period the market has
18 had ample funds to supply even the needs of some
19 marginal borrowers.

20 COMMISSIONER GIBSON: There would be
21 quite wide ranges in interest rates then over that
22 period?

23 MR. KEYSER: Right, and I would say at
24 the present time and until recently there have
25 been such supplies of corporate funds in the market
26 that very, very marginal borrowers have been given
27 a look at by potential investors.

28 MR. KENNER: The rates themselves are
29 extremely sensitive, varying almost as much as or
30 more than even treasury bills.

1 COMMISSIONER GIBSON: And varying, I take
2 it, quite closely in harmony with the treasury bill
3 market?

4 MR. KENNER: Very closely. The treasury
5 bill is one of the main guide posts of establishing
6 all these rates.

7 MR. KEYSER: Generally speaking I might
8 add that prime commercial paper rates generally vary
9 from one-eighth to one-quarter of one per cent
10 above the rates published by leading finance
11 companies at times when those leading finance
12 companies are in the market for funds in all
13 categories and it is going down.

14 COMMISSIONER GIBSON: Secondly, you would
15 have a good deal wider variation in rates, in
16 other words, there are some borrowers who would
17 have to borrow at a good deal higher rate from
18 time to time?

19 MR. KEYSER: Yes, until you get to the
20 time where, assuming the availability of funds,
21 these increasing rates get to the point where
22 the borrower has no longer got an advantage and
23 he then does his borrowing from the bank jobber.

24 COMMISSIONER GIBSON: What are the
25 usual terms of this paper, time terms?

26 MR. KEYSER: Very seldom does commer-
27 cial paper exceed 90 days in term and more
28 recently borrowers have shown a desire to borrow
29 on a two-way call, that is, on a 24 hour call
30 with a call option both to the investor and to

1 himself.

2 COMMISSIONER BROWN: Such a two-way call
3 frequently involves a rate differential?

4 MR. KEYSER: Yes, when it is a two-way
5 call generally the rate is one-eighth above what
6 it would be if it were called only by the investor.
7 In the case of one-way call-outs the borrower
8 protects himself by placing a period on it,
9 normally 30 days.

10 COMMISSIONER LEMAN: Is it your im-
11 pression that a charter to such a merchant bank
12 today would be refused unless there was special
13 legislation passed to recognize this type of
14 financial institution?

15 MR. KENNER: I think it would have to
16 be fitted into the Bank Act or at least into the
17 operations of the Bank of Canada so that there
18 would be adequate control of its operations. If
19 that could be fitted in, I see no reason why it
20 probably would not be granted but again this is
21 a fairly new market and it is possible that
22 somebody will try in the near future. They just
23 have not yet.

24 COMMISSIONER MACKINTOSH: Is there
25 anything to prevent one of the firms presently
26 operating a market from expanding its operations
27 in the direction of a merchant bank function?

28 MR. KENNER: No, I do not think there
29 is anything. It is just that it cannot be really
30 just an extension of the dealers' operations so

1 much. I think you want at least the depositors in
2 this operation would want it to be a separate
3 entity rather than just an addition to the dealers'
4 operations.

5 MR. KEYSER: I think one of the dis-
6 couragements to this development at the present
7 time is that the market is only just verging on
8 the point where it would be attractive to do this
9 and as a result we have not seen a great deal of
10 activity in this direction other than to observe
11 that several jobbers are buying commercial paper
12 at one term, the other at shorter terms. In a
13 sense they own it and they put it out among the
14 off street lenders on loan and in this sense
15 they are performing this function to a degree.

16 COMMISSIONER MACKINTOSH: Is the
17 acceptance of deposits an essential feature of
18 such an operation?

19 MR. KENNER: It would be necessary to
20 get most of the money that you would use to
21 finance the commercial paper from deposits or
22 notes or something of probably shorter term.

23 COMMISSIONER MACKINTOSH: Well, we
24 seem to hear of quite a few institutions who
25 undertake such operations and branch into the
26 deposit business although not set up as depositors?

27 COMMISSIONER LEMAN: Do dealers now
28 accept deposits in a certain form?

29 MR. KENNER: Generally, no.

30 MR. KEYSER: I believe there are certain

1 restrictions on their paying interest on deposits.
2 I believe the restriction has to do with the
3 Toronto Stock Exchange.

4 MR. KENNER: In fact, you have deposits
5 from those customers who have sold something but
6 have not told the dealer to pay them but they are
7 not really deposits of any size.

8 COMMISSIONER MACKINTOSH: Just balances
9 from their other investments?

10 MR. KENNER: Yes.

11 COMMISSIONER BROWN: You could buy them,
12 couldn't you?

13 MR. KEYSER: Yes, it could be looked at
14 in two ways. It is a sale, the dealer has sold
15 securities for a shorter term than shown on the
16 actual security itself, particularly if the
17 ultimate maturity does not exceed the re-purchase
18 date by a great deal and if that paper is readily
19 marketable between the time the dealer repurchases
20 it and its maturity and it could be conceived of
21 as an outright sale in this sense that it is
22 simply a favour to the buyer that you are tailoring
23 the security specifically to his needs and in that
24 sense it could be looked at as accepting a deposit.
25 If the market is in such a condition at the time
26 that the dealer has inventory that he is unable
27 to sell at advantageous prices in which case he
28 offers it on loan in a sense with a depositor.

29 COMMISSIONER BROWN: By that agreement
30 he is in effect putting his name on the paper as

1 well?

2 MR. KEYSER: But simultaneously, of
3 course, the dealer contracts to repurchase it
4 so that it shows on the dealer's books as a
5 contingent liability.

6 THE CHAIRMAN: We should adjourn for
7 a few minutes unless this is the last question.

8 COMMISSIONER LEMAN: I have a couple
9 of questions.

10 THE CHAIRMAN: Well, go ahead unless
11 there are some other questions. I am not trying
12 to close anything off but we usually adjourn
13 for a break in the morning.

14 COMMISSIONER LEMAN: In one answer
15 you made to Dr. Mackintosh a few moments ago you
16 got close to a point which is not really covered
17 in the brief but I would like your views about
18 it. Do you say there would be merit in a separa-
19 tion of the function of a jobber or dealer and
20 that of a broker - and I am not talking specific-
21 ally about this restricted field now but I am
22 talking about the field in general?

23 MR. KEYSER: Jobbers as opposed to in-
24 vestment dealers?

25 COMMISSIONER LEMAN: No, dealers as
26 opposed to brokers in the whole field of securities.

27 MR. KENNER: I do not think that any
28 separation would be really an advantage if the two
29 functions are -- where a lot of dealers are merely
30 servicing different parts of the investors' needs

1 and there is an advantage to have them together
2 because it is just fulfilling a slightly larger
3 need for the investor. But if you had a banker
4 in the group also maybe there would be an ad-
5 vantage having it slightly separated when you
6 are taking people's deposits and such.

1 COMMISSIONER LEMAN: How about the
2 specific function of the dealer as an underwriter?

3 MR. KENNER: Then being a broker also,
4 you mean?

5 COMMISSIONER LEMAN: Yes.

6 MR. KENNER: Having them all under one
7 roof as they are now, merely makes it easier to
8 fulfill all the functions. I cannot really see
9 any advantage in the split.

10 COMMISSIONER LEMAN: Do you see some
11 disadvantage?

12 MR. KENNER: Of splitting it?

13 COMMISSIONER LEMAN: No, no, you say that
14 it has an advantage of having them under one roof.
15 Do you see some disadvantage?

16 MR. KENNER: No.

17 COMMISSIONER LEMAN: None at all.

18 MR. KEYSER: Except that I think the
19 function of a large investment house as an under-
20 writer of new securities, as a seller of those
21 securities to both individuals and corporations
22 and as a broker in providing secondary markets
23 in those securities, I think that these functions
24 are complementary, and with the development of
25 the short term money market this too complements
26 the underwriting function in that it puts to work
27 temporarily funds that are realized by new under-
28 writing and it assists in handling funds that
29 are generated by your closed account and by other
30 accounts. I think there would be disadvantage if

1 it was only due to lack of communication among these
2 different functions.

3 THE CHAIRMAN: Any further questions?

4 Thank you very much, gentlemen. We will now adjourn
5 for about ten minutes.

6 --- A short recess.

SUBMISSION OF JOHN R. CAMPBELL, C.C.

MR. CAMPBELL: My lord, Mr. Chairman, and gentlemen. I feel a little presumptuous appearing, in that I am appearing just really as an interested person, perhaps with some experience in the National Housing Act market, with some thoughts as to the primary markets and the problems and questions that people have with respect to it, and also with perhaps some thoughts about the growth of a responsible secondary market for N.H.A. mortgages, and with some thoughts as to the extension of secondary market activities to conventional loans.

I feel perhaps the most important point that I have to make is that over the next few years, according to many economists, there will be some wild number of housing units of one kind or another required to be produced in this country, and a great deal of it falls within the purport or the intent of the National Housing Act as it is designed, in the recital of the Act, to encourage the building of medium and low-class, lower income family housing. The figures seem to be rather staggering in relation to the response of the market today, and particularly in the last five years, and it seems to me that there are some real problems, before we had the National Housing Act 1954, in relation to the size of our country - perhaps even before 1957 came along. Our institutions were able

1 to furnish the mortgage money required over a
2 longer period of time, and I feel that if we as
3 a nation constantly grow and need more houses,
4 that perhaps our institutions ought to have grown
5 or adapted to be able to do what they have in the
6 past.

7 Something seems to be wrong, in that
8 the government has found it expedient to provide
9 a very, very substantial portion of the mortgage
10 money that has gone into loans insured under
11 the National Housing Act, and it would appear
12 that unless some new stimulus to mortgage lending
13 and, in particular, mortgage lending in mortgages
14 insured under the National Housing Act, unless some
15 new stimulus is given to the lending pattern,
16 that we are going to form a very bad habit and
17 become almost completely dependent upon govern-
18 ment.

19 I had the privilege of sitting during
20 the first submission this morning and the first
21 part of it relating to this subject, and I am
22 sure I am not supposed to start debate with some-
23 body who spoke before me, but I took violent ex-
24 ception to the statement that was made or the
25 advocacy for a Canadian "Tanny May".

26 I do not see why the institutions we
27 have, plus perhaps additional servicing institu-
28 tions, cannot handle our requirements if we tailor
29 our product to more or less our usual conventional
30 way of doing business.

1 I see no particular merit in saying to
2 some individual, be he a lawyer or what he is,
3 that the government will guarantee the mortgage
4 on his house. In fact when people talk about
5 guarantees, right now under the National Housing
6 Act there is no such thing. It is an insurance
7 obligation and there are some conditions that
8 have to be met. It cannot be spoken of in the
9 same terms as a guarantee, it ought not to be
10 spoken of as a guarantee and I do not think it
11 ought to be a guarantee.

12 If it is a guarantee, then I would
13 agree with perhaps how Mr. Gibson put it, I
14 think, who said that the government should just
15 issue direct bonds and put money directly into
16 loans, and then we do not really have a problem
17 in the primary market or in the secondary market.

18 I also heard a comment from the
19 Commission that things seem to have to be en-
20 couraged before they are established. I think
21 that a responsible secondary market, which will
22 have certain benefits and will take some time to
23 grow, will be established without encouragements,
24 but perhaps with only the removal of a few little
25 technical problems that seem to slow down the
26 establishment of it.

27 I would refer the Commission to the
28 part 2 of the current Central Mortgage and Housing
29 Corporation report, where they discuss the mort-
30 gage market, and I am sure you probably read it.

1 I agree with a great deal that is said in here,
2 a great deal, and I think the intent is tremendous.
3 Referring to the last paragraph it says:

4 "Government activity in 1961 in the
5 secondary market is based on the ex-
6 pectation that with the development
7 of greater knowledge and familiarity --"

8 THE CHAIRMAN: Mr. Campbell, usually
9 we prefer to hear your summary of your submissions.

10 MR. CAMPBELL: I am sorry.

11 THE CHAIRMAN: The proposals that you
12 make, and these various other pieces of informa-
13 tion that you may have might be developed if
14 there are any questions to be asked.

15 I notice in paragraph 8 of your summary
16 there are certain recommendations that you make
17 which no doubt will be interesting.

18 MR. CAMPBELL: In summary, I recommend
19 that certain defects in the N.H.A. instrument be
20 cured, so that there will be a more responsive
21 primary market for N.H.A. mortgages, and that
22 present institutions adapt and new institutions
23 will come into being to assist in the growth of
24 a more active secondary market. The specific
25 recommendations that I have are contained beginning
26 at the bottom of page three of my submission in
27 paragraph eight.

28 Firstly, to cure some of the minor de-
29 fects in the mortgage, but which are acceptable
30 apparently only to sophisticated lenders and not

1 to the uninformed lenders, and therefore must act
2 as a deterrent from a broadening of the market.

3 (b) To have C.M.H.C. in the sale of its
4 mortgages, not only the billion and a half it has
5 in portfolio now, but the mortgages that it
6 ultimately apparently must acquire from time to
7 time in the future on a basis which will appeal
8 to the greatest number of potential buyers.

9 (c) I believe it is most desirable
10 to have the facility of the Canadian chartered
11 banks operating in the mortgage market, particularly
12 the N.H.A. market, not only as lenders but as
13 servicers. I think that that facility would tend
14 to become more available if there were no
15 impediments, real or imagined, to banks lending
16 and making N.H.A. mortgages. I believe that all
17 mortgages in the market ought to have the same
18 features as to the insurance obligation behind
19 them, so that they would all be marketable on
20 more or less the same basis, which is recommenda-
21 tion (d).

22 With respect to the new institutions
23 which could come into being and service a secondary
24 market and also provide an alternate primary market,
25 I believe that small impediments as exist in the
26 Canadian and British Insurance Companies Act, ought
27 to be amended, so that such companies may issue
28 and sell their securities in the most sure but in
29 the cheapest form as to cost.

30 I feel finally that C.M.H.C. has a broader

1 function to perform than it is currently per-
2 forming, and these functions are briefly - it is
3 not a function, this is a recommendation, this
4 first point - that it should sell its mortgages
5 on a different basis, that it should be a lender
6 of last resort, it should provide standby
7 commitments.

8 There are some helpful hints in the
9 way various government agencies operate in the
10 Federal Housing Act and other American acts, and
11 I think as a result of these things that over a
12 relatively short period of time we would find
13 ourselves in Canada in most periods of time,
14 with a completely adequate flow of private funds
15 for N.H.A. mortgages and, as a result of that,
16 will be able to seriously consider extending
17 N.H.A. loans to used housing and would find
18 that our conventional mortgage market would
19 improve as well.

20 Mr. Chairman, that is the basis of my
21 submission.

22 THE CHAIRMAN: Thank you. Questions?

23 COMMISSIONER LEMAN: Mr. Campbell, now
24 that you have read out the complete summary of
25 what you recommend, I would like to encourage you
26 to make the point you were going to make about
27 the report C.H.H.C.

28 MR. CAMPBELL: I took the liberty,
29 incidentally, of submitting some questions be-
30 cause I was advised that perhaps the Commission was

1 interested in questioning, and perhaps what I have
2 to say here affects one of those questions, but
3 the last sentence of the paragraph says that it
4 is the intent of the Corporation in doing what
5 it has been doing, to encourage a market
6 primarily based on private sources of capital.

7 "The Corporation's activity in this
8 field is not intended as a device to
9 raise cash for its own lending opera-
10 tions or for other government purposes.
11 The secondary market will serve a
12 useful purpose only if it brings in
13 to the mortgage field new investors."

14 And so on. I agree that this is a very desirable
15 intent. I question seriously whether the method
16 that C.M.H.C. is going about this will actually
17 have this result. It will in some areas but I
18 think in the end result I question seriously that
19 it will.

20 Perhaps the reason I question this is
21 made in the brief where I point out that the
22 C.M.H.C. improves their mortgage to some extent
23 over other mortgages that are available.

24 THE CHAIRMAN: What page of the brief
25 were you referring to?

26 MR. CAMPBELL: Page eight, item (b).

27 This perhaps is a technical point, that as to the
28 acceptability of title of mortgages on default,
29 that I have made a specific recommendation in de-
30 tail as to how this might be amended, but the terms

1 upon which C.M.H.C. sell their mortgages removed this
2 as a problem, because they tell you when you buy
3 a mortgage from them that when the mortgage comes
4 back the title you get was acceptable and will
5 still be acceptable then.

6 COMMISSIONER LEMAN: Mr. Campbell, before
7 we touch on the financial implications of this,
8 there is one thing I would like to be a little
9 clearer on. You have made a very thorough
10 analysis of the problems connected with this
11 whole field from a legal standpoint. This is a
12 field in which the Commission cannot delve very
13 much, but I would like to get your views on the
14 extent to which it would reach the objections that
15 you have in mind. One would be to convince the
16 provinces, for instance, in the field of registra-
17 tion, foreclosure procedures, all that sort of
18 business, to get more uniformity in the practices,
19 etcetera. Is this a big obstacle?

20 MR. CAMPBELL: Perhaps I can answer your
21 question in a different way, in that I have con-
22 centrated here on certain legal aspects. Perhaps
23 I could have concentrated more on the problems of
24 foreclosure in Alberta or some of the other local
25 problems, on the form of the instrument, transfer-
26 ability of a mortgage and so on.

27 I do not think these are important
28 problems that impede the growth of a secondary
29 market or the enlargement of the private primary
30 market to satisfy our country's needs. They are

1 little problems of doing business and they could
2 be cured, they will be cured, but I do not think
3 they really impede the growth of the market,
4 primary or secondary.

5 COMMISSIONER GIBSON: On the nature of
6 the problems, Mr. Campbell, you make a point that
7 there is a large gap in this area that, looking
8 ahead, you do not see too well filled. This is
9 a long term view. You are not talking of to
10 this particular moment.

11 MR. CAMPBELL: No, sir.

12 COMMISSIONER GIBSON: You are looking
13 ahead, what, a decade?

14 MR. CAMPBELL: I would say ten years.

15 COMMISSIONER GIBSON: And you are con-
16 cerned about there being a continuing gap over
17 that period if means for channelling funds in
18 this direction are not improved?

19 MR. CAMPBELL: Yes, sir, I think
20 perhaps it might have been shown in widened
21 terms.

22 COMMISSIONER GIBSON: What would you say
23 the present situation was?

24 MR. CAMPBELL: Right today?

25 COMMISSIONER GIBSON: Yes.

26 MR. CAMPBELL: Well, I think right today
27 as opposed to, for instance, last year, most people
28 who wanted to get N.H.A. mortgages can find them
29 in the private market.
30

1 COMMISSIONER GIBSON: So we have had what
2 you regard as a temporary but quite marked improve-
3 ment recently in this particular direction.

4 MR. CAMPBELL: Yes, we have had this
5 several times before in the last six or eight
6 years, and I can foresee that we would still have
7 these periods from time to time.

8 COMMISSIONER GIBSON: And you think
9 that such kinds of things that you have in mind,
10 developments occurring in this sort of direction,
11 that the supply of funds for C.M.H.C. mortgage
12 purposes would be more even, less variable than
13 it has been?

14 MR. CAMPBELL: If I may just refer a
15 moment to a study in the United States by
16 Professors Oliver Jones and Leo Grobler of the
17 University of California on the subject of the
18 secondary market in the United States, with
19 particular emphasis of F.H.A. and V.A. loans.
20
21
22
23
24
25
26
27
28
29
30

1 Their comments are -- and I would agree with this in
2 general -- that the secondary market as it has
3 developed in the United States, which according to
4 them is unsatisfactory, has not as yet tended to even
5 the flow of funds into government insured mortgages.
6 On the other hand, a secondary market, if it is
7 responsible and responsive, ought to tend to even the
8 flow of money into a particular market. They make
9 a point in this book --and I think perhaps it is
10 a sensible point -- that during periods of tightness
11 of money, restrictions of credit, and so on,
12 municipalities are still able to raise the funds they
13 require. In the case of municipalities, it is a
14 function of interest that they are willing to pay,
15 whereas in periods of tightness money mortgages do
16 disappear.

17 COMMISSIONER GIBSON: In the case of
18 municipalities you have a variable interest rate; the
19 money can be obtained at a price; is that the point?

20 MR. CAMPBELL: This is the point.

21 COMMISSIONER GIBSON: Whereas you don't have
22 the same variation of interest rate in this area,
23 and sometimes money cannot be obtained?

24 MR. CAMPBELL: This is correct.

25 COMMISSIONER GIBSON: But this is one of
26 the objectives you have in mind, to get a somewhat
27 less variable flow?

28 MR. CAMPBELL: Yes, indeed, and I believe
29 our particular system in Canada, helped on by the
30 particularly outstandingly good feature of the

1 National Housing Act,
2 and that is the cash settlement as opposed to a
3 20-year debenture of insurance payout, is the kind
4 of thing that can create a mark of confidence in a
5 mortgage so that the paper can survive within reason-
6 able interest limits in periods of money tightness.

7 COMMISSIONER MACKINTOSH: Why should mortgage
8 interest rates be sticky and unresponsive -- more
9 so than changes in other parts of the market?

10 MR. CAMPBELL: Well, I am not sure I am
11 qualified to answer your question. I will take a stab
12 at it.

13 COMMISSIONER MACKINTOSH: I am not sure I
14 am qualified to ask it.

15 MR. CAMPBELL: Well, put it this way: I
16 would rather be asking it than answering it. Mortgages,
17 as has been mentioned this morning -- and I think
18 it is probably pretty generally recognized -- are
19 specialized pieces of paper. As this C.M.H.C. report
20 says, they require a certain amount of expertese, and
21 when this expertese in Canada seems to be pretty
22 generally concentrated in large institutions, and
23 these large institutions have other investment
24 objectives as well as just mortgages, let alone just
25 N.H.A. mortgages, the problem of going into a 20
26 per cent N.H.A. loan is that as soon as the rates
27 fall to 15 per cent it will be pre-paid, and besides
28 all that our respectable large financial institutions
29 would not dare get involved in a 20 per cent loan
30 to start with -- and I am using violent figures to

1 make my point. I think that investors, particularly
2 institutional investors, tend to shift to non-mortgage
3 investments when the interest rate on non-mortgage
4 investments comes up to what they consider to be
5 reasonable, and therefore they do not have to reach
6 for the higher rates on mortgage investments, which
7 higher rates they will lose as soon as the fellow
8 can re-finance. He can get himself a good 15-year
9 province of Ontario bond of some sort at a pretty
10 high rate, so he is probably going to take that
11 10 years, for certain, and in the course of doing
12 so properly fulfill his obligation to the shareholders
13 to earn money, because three years hence the mortgage
14 rates will be down and the fellow who paid you
15 6-3/4 or 7 1/2 is going to be around to re-finance.
16 I think perhaps you get the shift from mortgage to
17 non-mortgage investments.

18 COMMISSIONER BROWN: Would you like to
19 see them more responsive -- some way they can be
20 repaid for a longer period?

21 MR. CAMPBELL: I hesitate to say this,
22 but I think mortgagors have more protection than
23 mortgagees, and there are some areas of protection
24 of investment which have a beneficial consequence
25 where restrictive rules in favour of mortgagees
26 could be established. The government did one of these
27 not too long ago, in that they made N.H.A. mortgages
28 on multiple housing -- apartments and various multiple
29 housing units where they are not dealing directly
30 with the individual -- from corporate borrowers non-

1 repayable for ten years. As the result of that
2 particular move, it seems to me when you have perhaps
3 an average life of 14 years on these loans that a
4 pretty stable financial arrangement can be made.
5 which is not subject to every little variation.

6 COMMISSIONER BROWN: My next question I
7 would like to get back to the previous discussion
8 and proposition^{and} and one of your objectives/is to
9 get a reasonably steady flow of money into the mortgage
10 field. If this were accomplished, wouldn't this,
11 in fact, insulate the mortgage field from monetary
12 policy, and is this also your objective?

13 MR. CAMPBELL: No, quite on the contrary,
14 I don't think it would insulated it from the whole
15 monetary field, and it is certainly not part of the
16 objective. The objective is to try to have interest
17 rates on mortgages flow with interest rates on other
18 costs and to have the money available at the price
19 it takes to get it available. I feel that you should
20 concentrate on trying to improve the instrument,
21 and I have suggested two ways of improving^{it}-- the
22 investment interest: One, by curing some of the
23 defects that cause the primary market to be reluctant
24 to go into it in volume; and two, create a debenture
25 as of a more liquid and more marketable form of
26 indirect investment which could support both additional
27 primary investment and secondary market activity,
28 and those things certainly are not in any way
29 insulated from monetary policy.

30 COMMISSIONER BROWN: But if the flow of

1 money is to be evened out, it means in times of
2 tight money there is still the same amount of money
3 available for mortgages as in times of easy money --
4 or , just at different interest rates?

5 MR. CAMPBELL: This is perhaps going to
6 a specific recommendation which I have made. It
7 seemsto me that nothing is going to even the flow of
8 money into anything. You always have the point of
9 choice of investment, and I don't think, unless you
10 do it solely through government, that you can control
11 it. You certainly can use the function of government
12 to assist it. I think in the long haul of establishing
13 a secondary market for secondary mortgages where
14 the investor's requirements change, and he has to
15 get rid of mortgages with^{as} equal ease as he could get
16 rid of bonds, then I say you have acoomplished
17 something, but until that time has arrived --- and it
18 may never arrive; you will continue to get to it --
19 but in the immediate short-term government ought
20 to be able to perform its function of where it sees
21 it is necessary to keep the housing industry going --
22 and this is certainly desirable -- to make lower
23 interest rate loans, or take part of a loan, give
24 the mortgage investor, the bank or the trust company,
25 or whoever, a take-out for two years hence so that
26 there is some method of at the present time keeping
27 the investment interest/^{ed} in going into N.H.A. mortgages
28 instead of just cutting them right off. As I said
29 a shift from mortgage to non-mortgage investments
30 would do.

1 COMMISSIONER MACKINTOSH: You want them
2 to have a dependable share of the market and not
3 just a residual?

4 MR. CAMPBELL: Yes. There are lots of other
5 things involved too. The market for the end products
6 has to be borne in mind, but this surely is the
7 point of decision of the builder, the developer
8 and so/-- whether he wants to take that risk.

9 COMMISSIONER GIBSON: But you are hoping
10 also to see a larger relative flow of funds into
11 C.M.H.C. mortgages, as I understand; is that correct?

12 MR. CAMPBELL: Yes. It appears that the
13 private market could on an average more than double
14 its present investments into N.H.A. mortgages on
15 some average regular annual basis.

16 COMMISSIONER GIBSON: Where would you
17 envisage these funds as coming from?

18 MR. CAMPBELL: It does not create any new
19 capital.

20 COMMISSIONER GIBSON: You mean this
21 replaces government funds?

22 MR. CAMPBELL: It replaces government funds.
23 It does not create any new capital, attempting to
24 do this. It may create some new capital in that
25 it drives down interest rates -- it tends to drive
26 down interest rates -- and gives builders the
27 opportunity to make savings so that there is a very
28 small, perhaps, growth of new capital or available-
29 for-something else capital; but I just think this
30 segment of the money market, which is large, should be

1 able to compete for the available capital all round.

2 COMMISSIONER GIBSON: But you see this
3 growing, don't you?

4 MR. CAMPBELL: Oh, yes.

5 COMMISSIONER GIBSON: And under that
6 housing agreement, particularly with this increase
7 in the population, in the number of people of
8 marriageable age which is going to occur very soon,
9 doesn't that mean that more funds will relatively
10 be needed now?

11 MR. CAMPBELL: Mr. Gibson, I have said that
12 it would appear from 125,000 to 150,000 new housing
13 units per annum -- and if I were to be pinned down
14 I think I would probably take a stab at maybe an
15 average of 145,000 over the next 10 years, and a
16 large amount of this type of housing should fall
17 within the purport of the National Housing Act,
18 in that it is for middle-income families, and that
19 is rather closer to the \$900 million available than
20 to the \$600 million figure I have in here. The
21 private institutions sort of tend to average out
22 more than \$300 million over the last few years.
23 There is a very large gap.

24 COMMISSIONER GIBSON: But you think of
25 this gap as being mainly not a gap in the total
26 financial requirements of the country, but a gap
27 in the sense it is now being provided by government
28 rather than through private sources; is it correct
29 to put it that way? In other words, you are thinking
30 of a stage of more private funds going into this area

1 and less government funds?

2 MR. CAMPBELL: Yes, that is definitely
3 correct.

4 COMMISSIONER GIBSON: If you have such a
5 stage, does it follow the private funds will come
6 from the same source as the government funds? The
7 government has to raise its money in the market or
8 through the tax system.

9 MR. CAMPBELL: Yes.

10 COMMISSIONER GIBSON: So this may have a
11 different effect on the economy.

12 MR. CAMPBELL: Well, yes, if you have
13 another \$500 million competing for the available
14 investment funds in a year it certainly would have
15 a lot of effects.

16 COMMISSIONER GIBSON: Have you thought
17 about this very much? Do you see it affecting the
18 market for other obligations?

19 MR. CAMPBELL: Well, it certainly seems
20 logical that it would. This is a fairly large
21 requirement of money in a country of this size. It
22 seems it would certainly drive other borrowers to
23 other markets at higher rates.

24 COMMISSIONER GIBSON: But would those
25 borrowers be the government of Canada and other
26 governments in particular -- maybe this is going
27 too far afield?

28 MR. CAMPBELL: No, I don't think it would
29 be, because their credit in the money market is
30 always a little better than -- unless you provide

1 the housing money by government bonds -- their credit
2 is always a little bit better, and the rates of
3 interest they have to pay. I think it would probably
4 drive some aspects of the commercial borrowing and
5 some aspects of municipal borrowing -- perhaps make
6 them more competitive.

7 COMMISSIONER GIBSON: It would be really
8 rather hard to do because relatively you are trying
9 to make the C.M.H.C. mortgage into a more interesting
10 thing relative to everything else?

11 MR. CAMPBELL: Yes.

12 COMMISSIONER GIBSON: So, how much other
13 kinds of instruments would be affected you could
14 hardly determine in advance?

15 MR. CAMPBELL: I am sure it would be hard
16 to determine in advance, but the other side of that
17 question is the way the N.H.A. mortgage is now:
18 Why should it be singled out for special treatment;
19 why should it be a political football; why should
20 it be all of these things? If there is the
21 possibility of creating competition with the other
22 non-mortgage investments, then we ought to be looking
23 hard at that possibility.

24 COMMISSIONER MACKINTOSH: Following on
25 from that, Mr. Campbell, where do you think there
26 are the sources of capital for these N.H.A. mortgages
27 that are at present not being used?

28 MR. CAMPBELL: Well, I understand that
29 pension funds which are growing and will continue
30 to grow currently only have 8 per cent of their

1 assets in mortgages and I believe that if the
2 mortgage could be made a more attractive piece of
3 investment paper either directly in the mortgage
4 or a bond secured on a mortgage that pension funds
5 and pension trustees will be more favourably
6 disposed to go into mortgages and take these slightly
7 higher yields from government bonds.

8 I believe -- and this perhaps particularly
9 goes to the question of the sale of bonds secured
10 on mortgages -- that you have a more attractive piece
11 of paper to get at people's savings in this form
12 of investment. I feel if you have entities, not
13 just one but competitive entities in the market
14 that are financing their requirements through the
15 sale of bonds, that it is feasible to get more
16 of the monies available in the short-term money
17 market. I mean, for instance, every year some
18 principal is paid off a mortgage. Well, surely
19 for that year you could finance that mortgage
20 requirement in the short-term money market.

21 And then I think you could attract foreign
22 capital and on a borrowed basis I am sure it must
23 be more desirable than to have it on an equity-
24 ownership basis. Here again, particularly in the
25 form of bonds or debentures secured on mortgages
26 you could create a piece of paper which, for example,
27 in the United States could qualify for investment
28 by, say, two-thirds or three-quarters of their
29 investment market opposed to a Canadian mortgage
30 which has a very limited number of possible investors.

1 Most of them who could possibly have any interest
2 are here already.

3 So that there certainly is a broad
4 opportunity to import capital on a borrowed basis
5 which is most desirable as opposed to equity through
6 this method.

7 COMMISSIONER GIBSON: Looking at the
8 import, how do you cope with the exchange risk
9 in selling mortgages outside of Canada?

10 MR. CAMPBELL: Well, it seems that there
11 have been times in the last year or one of them
12 when you could have sold all the Canadian pay
13 securities on the foreign market in New York,
14 secured on N.H.A. mortgages that anyone would have
15 wanted to do last year.

16 COMMISSIONER GIBSON: All Canadian pay?

17 MR. CAMPBELL: All Canadian pay.

18 COMMISSIONER GIBSON: Of course the buyer
19 would have paid the exchange?

20 MR. CAMPBELL: Yes.

21 COMMISSIONER GIBSON: Are there many
22 times when this is the case?

23 MR. CAMPBELL: I would rather have you
24 answer that question. Sure that has happened. I
25 have been interested in this subject for some time
26 and this was about the third time this has happened
27 in six or seven years.

28 COMMISSIONER GIBSON: So you think an
29 alert organization would see these opportunities
30 and use them?

1 MR. CAMPBELL: Oh, absolutely. There
2 was an opportunity to sell all the 6-3/4 per cent
3 mortgages held by Central Mortgage and Housing
4 Corporation at a fair price, not that that would
5 have accomplished anything more than what has
6 been accomplished already -- maybe even accomplished
7 less but the opportunities do arise.

8 COMMISSIONER LEMAN: And the C.M.H.C.
9 itself did not try that market?

10 MR. CAMPBELL: This was not a market
11 for direct investment in mortgages. This was a
12 market for investments in bonds secured by mortgages.

13 COMMISSIONER LEMAN: If, as you say, the
14 gap is very large and the investment by C.M.H.C.
15 shows that it has been large, how much of this gap
16 would this foreign source in your opinion fill?

17 MR. CAMPBELL: Well, going back to
18 Mr. Gibson's line of conversation I would think
19 that the N.H.A. requirements of direct investment
20 in improved mortgage and investment in bonds of
21 a mortgage company would compete in any Canadian
22 market and certainly get some of the Canadian
23 capital which would leave some other part of the
24 Canadian capital market requirements short and
25 that the sort of excess would have to go outside.
26 Some of that, of course, would be directly for N.H.A.
27 mortgages, some of it would perhaps be for the bonds
28 of a bathtub manufacturer -- I don't know.

29 COMMISSIONER LEMAN: Mr. Campbell, you
30 are thinking of the United States market, I gather

1 when you say foreign?

2 MR. CAMPBELL: Yes.

3 COMMISSIONER LEMAN: If this is true does
4 it mean that through pushing interest rates down
5 quite low in the mortgage field in the United States
6 itself through the various means they have used
7 down there, isn't there a gap down in the States
8 that is quite large if you eliminate governments?

9 MR. CAMPBELL: Well, I am not an expert
10 on the American mortgage financial market. I
11 included in this brief a paragraph at the end
12 relative to what Fanny May's operations have been
13 and I note the fact they are a buyer of mortgages
14 but proportionate to Canada, that is, with C.M.H.C.'s
15 direct investment in mortgages, they are just an
16 evening of the market. I have also read what
17 this American study of the secondary market has to
18 say on the subject and they seem to feel that
19 government via the various entities other than
20 the Fanny May organization itself is not a net
21 large investor in mortgages.

22 So that by the use of all of their
23 various little techniques and mortgage bankers
24 etc. -- this is a much more complex market down
25 there -- they seem to be able to take care of a
26 large part of their mortgage requirements without
27 having had government investment in it.

28 COMMISSIONER LEMAN: In other words,
29 they do not have the same gap as we have up here?

30 MR. CAMPBELL: They do not seem to have it

1 and they do not seem to be likely to get it although
2 they complain their secondary market is not
3 operating effectively either but they are well on
4 the way to using their various government and
5 non-government instrumentalities to solve these
6 various problems. Their government instrumentalities
7 seem to be primarily warehouses and that is how they
8 tend to even the flow. They warehouse mortgages
9 or give commitments or do something like that during
10 the periods of credit restriction.

11 COMMISSIONER BROWN: Do you think that
12 the development of some institution into a building
13 society with authority to invest in N.H.A. mortgages
14 would serve any purpose in Canada?

15 MR. CAMPBELL: I think it might serve
16 a purpose but I am very taken with the fact talking
17 to many of banker friends that we have perhaps
18 3,500 out of 5,500 bank branches that could serve
19 as mortgage dealers so that we have those facilities
20 and we are not using them fully and we are being
21 a little stupid. We do not need either mortgage
22 competitive outlets or servicing agents; we have
23 more than enough. What we need is routes to
24 the capital.

25 COMMISSIONER BROWN: This could be
26 resolved by getting the banks to become involved?

27 MR. CAMPBELL: It would tend to resolve
28 by directing banks to be involved, taking these
29 artificial restrictions out of the rate or large
30 trust companies could create mortgages by removing

1 some of these unattractive features to the mortgage
2 which prevent new institutions from rapidly growing
3 which would operate in both the primary and the
4 secondary market.

5 I would foresee, for instance -- I don't
6 know whether they would foresee this but I would
7 foresee where some of our larger trust companies
8 could very well have gone into N.H.A. mortgages
9 and into which they could place short, medium and
10 long-term paper. This is just another method of
11 this mortgage.

12 COMMISSIONER BROWN: In other words,
13 the trust company would be filling the same place
14 somewhat as a building society?

15 MR. CAMPBELL: Yes, but this is just
16 sort of an extension of our existing institutions,
17 that perhaps these mortgage company institutions
18 who would deal solely with these mortgages could
19 be used until it was well established and had
20 grown up enough to extent its whole operations
21 into conventional mortgages.

22 COMMISSIONER BROWN: Can you give us
23 any picture at the moment of what the demand is
24 for housing? Is there a shortage of housing in
25 Canada?

26 MR. CAMPBELL: I think there are an
27 awful lot currently of unsold houses and vacant
28 houses but again this has happened periodically and
29 undoubtedly will continue to happen periodically.
30 Even if we do accomplish the 10 years estimated
average requirements and we have over 145,000 units
per annum, in reaching that average we will have
had periods when there tends to be housing shortages
and tends to be surpluses and, of course, these are

1
2
3 geographic -- they tend to be geographic right
4 now because mortgage money is available in Toronto
5 where it is not available in Corner Brook, Newfoundland
6 so that you do not have much of a surplus of
7 houses in Corner Brook whereas an investor is happy
8 to take a mortgage in Toronto.

9 COMMISSIONER BROWN: You cannot give
10 us the figure on what the total is?

11 MR. CAMPBELL: Total? No sir.

12 COMMISSIONER BROWN: Or a shortage or
13 surplus?

14 MR. CAMPBELL: C.M.H.C., I think, publish
15 a sheet on this almost weekly or daily.

16 COMMISSIONER LEMAN: You have just made
17 reference here to this difficulty related to remote
18 areas. How would you handle this particular problem
19 otherwise than by keeping the C.M.H.C. as a direct
20 lender?

21 MR. CAMPBELL: Well, I think there will
22 always be special situations where C.M.H.C. or
23 government in some function is necessary. Perhaps
24 it is better that they loan the money to the banks
25 on the condition that they will lend in remote
26 areas on suitable terms instead of doing it themselves.
27 But in this I do agree with the previous submission.
28 If you can tend to have one mortgage be the same
29 as the other in certain aspects of its investment
30 character then it seems to me that the bank branch
31 in a remote area, the manager, can follow a set
32 of rules and service that mortgage there just as well
33 as the manager up in North York can service a mortgage
34 there and we would tend to overcome this geographic

1
2
3 discrimination that does exist and is a serious
4 problem. This was the excuse for getting Central
5 Mortgage going in such large volume. Then, we
6 had a period of tight money and that covered other
7 areas and now we have just got a big bad habit.

8 COMMISSIONER LEMAN: It seems to me
9 when people talk about residential mortgage they
10 seem to lose the propensity on which normal market
11 forces operate. Isn't it possible in view of the
12 gap you referred to and in view of the ambition
13 that everybody has to create a system that will
14 produce lower interest rates for residential houses
15 that today we are being a little too ambitious?

16 MR. CAMPBELL: I think we are too
17 ambitious if we try to accomplish it overnight and
18 for this reason there is a certain amount of
19 artificiality in the whole theory of the National
20 Housing Act but in the long run I do not think
21 there is anything unsensible about this.

22 COMMISSIONER MacKEEN: Mr. Campbell,
23 when you said that mortgage money was not available
24 in places like Corner Brook did you mean National
25 Housing Act money or conventional?

26 MR. CAMPBELL: I mean mortgage money
27 generally. There is a local market which I guess
28 provides some but large institutions who do not
29 have servicing agencies in the remote areas do not
30 want to take these mortgages on because the servicing
cost is too large. If Sun Life have a branch in
Edmonton but not 70 miles north or 170 miles north
of Edmonton they are pretty reluctant to go 170
miles north but my point is the banks have a branch

1
2
3 170 miles north of Edmonton and if we were to make
4 full use of our facilities we would tend to end
5 this geographic discrimination.

6 COMMISSIONER MacKEEN: Corner Brook is
7 what might not be too good an illustration.

8 MR. CAMPBELL: I am sorry, I should not
9 have mentioned any place. Perhaps I should have
10 said Toronto and nobody could throw a stone.

11 COMMISSIONER LEMAN: Do you feel that
12 a mortgage in Uranium City should attract the same
13 rates as a mortgage on the outskirts of Toronto?

14 MR. CAMPBELL: Well, that is a double-
15 barrelled question. You are dependent upon a
16 Blind River situation obviously not because the
17 servicing agencies that are involved here should take
18 these risks in servicing and the investor should take
19 these risks. Perhaps when you get a specialized
20 company town situation you do get closer to what
21 I foresee, a proper government function for assisting
22 taking of risk but that is a different question than
23 a remote area. I feel basically that remote area
24 mortgages can be serviced as cheaply or almost as
25 cheaply as urban area mortgages and that they can
26 be made to be worth on the market the same amount
27 of money without too much cost to the government,
28 without too much addition to the contingent liability
29 of insurance company funds etc. I think there is
30 a good point to this trying to make one mortgage
the same as the other within reason, within limitations.
THE CHAIRMAN: Yes, but in the more remote
areas there is not the active market for real estate
that there is in the more congested areas so that that

1
2
3 affects the value, doesn't it, of the mortgage?

4 MR. CAMPBELL: Mr. Chairman, yes it does
5 but it also --

6 THE CHAIRMAN: It may be that the land
7 is just as good and the people are just as credit-
8 worthy but there is a big difference.

9 MR. CAMPBELL: It affects the amount
10 of mortgage you can get there in the first place.
11 It affects the whole character of the housing and
12 has and will continue to do so unless we try to
13 make something very artificial so that everybody
14 can have a, say, \$32,000 house.

15 THE CHAIRMAN: But N.H.A. mortgages are
16 for houses built according to N.H.A. standards,
17 are they not?

18 MR. CAMPBELL: Oh yes, but there is a
19 broad price range of houses that can be purchased
20 under the National Housing Act.

21 COMMISSIONER MACKEEN: Mr. Campbell,
22 would you suggest that in the outlying sections
23 because there was a chartered bank branch there
24 that the manager would be qualified as a banker in
25 determining the value of a house for loaning purposes
26 or servicing the loan after it has been made?

27 MR. CAMPBELL: No, I would not make
28 that suggestion at all. If he happened to be he
29 would certainly find himself in head office pretty
30 rapidly. I do suggest, however, that he could follow
a set of rules to administer a loan there and I also
feel that there are mechanics available for the
valuation of that house and the limiting of the size
of the mortgage and what have you which do not depend

1
2
3 on his knowledge but depend on the knowledge of
4 specialized expertise in mortgage finance and the
5 manager in Head Office and his staff and depend
6 on the expert people that we are really blessed with
7 in C.M.H.C. who say: "This is the maximum amount of
8 loan we will insure here". They have done a fine
9 job.

10 COMMISSIONER MacKEEN: Do you think
11 the actual officer concerned in making the loan
12 should be a highly qualified individual?

13 MR. CAMPBELL: I think the individual
14 person making the loan should be able to follow a
15 set of rules for the making of loans and have
16 normal expertise in the field of personal credit
17 which all local bank managers have because you have
18 a covenant in there which is very important in the
19 mortgage. I feel it does not depend upon the local
20 bank manager being qualified as a mortgage man.

21 COMMISSIONER GIBSON: Would you care to
22 say a little more about why the market for N.H.A.
23 mortgages is so inadequate? In your brief you say
24 that only four of five institutions are continuing
25 to take N.H.A. mortgages and lending real money.
26 I take it at other times there have been quite a
27 lot more and the amount has varied. Why is it
28 there seems to be such loss of interest in N.H.A.
29 mortgages?

30 MR. CAMPBELL: There was one aspect
31 to this conversation we covered earlier where we
32 talked about the attractiveness of mortgage funds
33 as opposed to non-mortgage investments which I think
34 affects the answer but specifically I think those

1
2
3 features which are unattractive and cause a
4 mortgage investment officer in an institution to
5 question the value of the value of the insurance
6 obligation has had a large part to play.

7 Now, obviously I cannot name names
8 but I have told you in my brief that one company
9 used to make N.H.A. mortgage loans and it no longer
10 does because it feels that the insurance obligation
11 is not adequate, it is not -- I hesitate to say is
12 not worth the paper it is written on but it does
13 not mean enough to them to attract them in. To
14 them there are too many things like that and so
15 they do not make the mortgage loan.
16
17
18
19
20
21
22
23
24
25
26
27
28
29
30

1 COMMISSIONER GIBSON: You believe there
2 is a fairly general feeling or quite a widespread
3 feeling, let us say, in this direction - not as
4 strong as that - but that there are quite a lot
5 of institutions who buy mortgages, who are just
6 not interested in N.H.A. mortgages?

7 MR. CAMPBELL: That is right, and there
8 are quite a lot of institutions, at least a few
9 institutions that do buy them perhaps recognize
10 these defects that have a large volume of funds
11 for investment and this is a convenient market.
12 They have a sophisticated approach to mortgage
13 matters and perhaps would be willing to make
14 85 per cent loans without insurance, and so they
15 are willing to go into this. On the other hand,
16 from my personal knowledge I know of fairly
17 substantial amounts of money which have not
18 found their way to this market because of these
19 technical defects.

20 COMMISSIONER GIBSON: Of course in
21 theory if conventional mortgages were popular
22 and a lot of people would make and buy mortgages,
23 you would think that after a while the rate on
24 conventional mortgages would be down sufficiently
25 so that the N.H.A. mortgages would become
26 attractive. There would be some adjustment in
27 the relative interest rate.

28 MR. CAMPBELL: This just happened quite
29 recently.

30 COMMISSIONER GIBSON: Yes, but I take

1 it you still do not think that has nearly corrected
2 the lack of interest in that kind of mortgage as
3 an underlying problem.

4 MR. CAMPBELL: No, I think these things
5 are bound to happen from time to time, but as
6 far as any long range programme is concerned I
7 think you have to have the unsophisticated in-
8 vestor completely protected.

9 Maybe I am going too far in that state-
10 ment without saying what things I mean first.
11 The unsophisticated investor should not have to
12 rely on his own expertese in mortgage investments
13 because he has none.

14 COMMISSIONER GIBSON: No, I understand
15 this as to the unsophisticated investor, but I
16 am just asking you about what the people that
17 really know about mortgages, insurance companies,
18 trust companies and so on, about their views.
19 This is their business, they know about it, so
20 I do not think you can talk about them as being
21 unsophisticated in any way.

22 MR. CAMPBELL: Oh, no.

23 COMMISSIONER GIBSON: Well, they are
24 not particularly interested, or a lot of them are
25 not particularly interested, so you do not
26 necessarily have to go so far as to make it
27 interesting to the unsophisticated investor.
28 Perhaps we could start by making it more in-
29 teresting to the sophisticated investor.

30 MR. CAMPBELL: Well, a lot of the

1 sophisticated investors are under a misapprehension
2 that it is far, far more complicated to get into
3 and to administer an N.H.A. mortgage than it
4 really is, so right away they are in the unsophis-
5 ticated class.

6 A lot of the sophisticated mortgage
7 investors are prepared to make more than 66 per
8 cent loans, and to make these, if they can find
9 a means of doing it, on a grade A lease-back,
10 they will choose this over, you know, $7\frac{1}{4}$ per
11 cent over 15 individual houses or two small
12 apartment buildings under the National Housing
13 Act.

14 I think we get back to the point of
15 competition here. Try to make our N.H.A.
16 mortgage compete with other investment, even
17 other mortgage investment situations. I am not
18 answering your question, I know, really.

19 COMMISSIONER BROWN: Would that then
20 make it more difficult for the others?

21 MR. CAMPBELL: I don't think I got the
22 point of your question.

23 COMMISSIONER BROWN: You are now talking
24 about N.H.A. mortgages, making them more accept-
25 able, more competing with others.

26 MR. CAMPBELL: Yes.

27 COMMISSIONER BROWN: So that it would
28 attract those people to buy, invest in N.H.A.
29 mortgages instead of conventional. Would that
30 not then make it more difficult for the con-

1 ventional?

2 MR. CAMPBELL: Yes, they are competing
3 in the same money market generally, so it would
4 tend to make it more difficult.

5 COMMISSIONER BROWN: For the conventional
6 mortgage?

7 MR. CAMPBELL: Yes, but surely the whole
8 function of the government insurance obligation
9 attached to this mortgage should make it more
10 desirable than conventional loans, so that this
11 should follow. I mean, this would be a desirable
12 thing.

13 COMMISSIONER BROWN: Then in effect
14 they would be getting more N.H.A. money by taking
15 it away from conventional mortgages?

16 MR. CAMPBELL: I think that is an over-
17 simplification.

18 COMMISSIONER BROWN: I am talking
19 about the specific example you were discussing,
20 with the unsophisticated and sophisticated.

21 MR. CAMPBELL: Yes, but I do think
22 that to the extent that the mortgage department
23 is going to allocate funds as between conventional
24 and N.H.A. loans it certainly would tend to take
25 it away from the conventional field, but I am
26 inclined to think that the mortgage department
27 might get more funds if this happens.

28 COMMISSIONER LEMAN: Mr. Campbell,
29 perhaps I had missed part of what you have been
30 telling us here. We are jumping about a little bit

1 in our questions. I would like to ask you a
2 question that is a little bit more direct. We
3 are talking about a large gap in funds available
4 for a specific purpose.

5 MR. CAMPBELL: Yes.

6 COMMISSIONER LEMAN: Your brief deals
7 with a lot of technical questions, and I think
8 it is commendable that you would want to remove
9 any technical obstacles in order to let the
10 market forces work more smoothly, that is basic-
11 ally the approach.

12 MR. CAMPBELL: Yes.

13 COMMISSIONER LEMAN: What I would like
14 to know is, suppose you did remove these technical
15 difficulties, then from that one factor how much
16 of the gap do you think you would close? Is it
17 the result of having these disregarded market
18 forces in the basic yield on this investment
19 that has created the gap, or is it more in the
20 technical. Is my question quite clear?

21 MR. CAMPBELL: Your question is quite
22 clear. I hesitate to answer it because may be
23 this is the whole reason I have this brief in and
24 pick out these points, and I have in parenthesis
25 what I am saying here, and I think the removal of
26 those things, would strongly tend to close the
27 gap.

28 I have had enough personal experience
29 and commitments to feel that it could have from
30 time to time in the past, and therefore it is very

1 likely to be able to accomplish this in the future.

2 I could go on and pick out foreclosure
3 procedures in Alberta and 1500 more little things
4 that are wrong. This may appear technical but it
5 really is basic, and certainly there are other
6 markets forces at work, but you have to get out
7 and compete for your money. Isn't this really
8 basic?

9 COMMISSIONER LEMAN: Well, Mr. Brown
10 was actually trying to get at what other gaps
11 would you open up if you closed this one; that
12 basically there may have been periods, there have
13 been periods, in Canada when there was a gap in
14 the total investment funds of the country.

15 MR. CAMPBELL: Right.

16 COMMISSIONER LEMAN: And to close a
17 big one like this, might you not open others?

18 MR. CAMPBELL: Yes, but I started off
19 by saying that 20 years ago we did not have
20 much of a gap. We just, I think, started the
21 Dominion Mortgage Act at that point. Maybe it
22 is 25 years ago, but this gap has been widening
23 and it is getting worse, and the mortgage market
24 is getting singled out year after year after year,
25 and it is sort of getting conventional, you know,
26 to treat it the way it has been treated. I feel
27 we should try to get back to the state where every-
28 body is competing for the available supply of
29 money, and not leave the housing industry out of
30 it entirely.

1 COMMISSIONER LEMAN: About 20 years ago,
2 if we did not have this gap as apparently it is
3 today, we must have had a housing shortage by
4 today's standards.

5 MR. CAMPBELL: Oh, yes, and I suppose
6 for a long time to come, on some Utopian standard,
7 we will always have a housing gap.

8 We should try, from the sociological
9 aspect of the thing, realistically to prove
10 what our requirement is and reach it. By re-
11 moving the things which seem to have over the
12 past many years, maybe 20, created this artificial
13 gap, then at least the normal forces at work can
14 compete. I can go and borrow \$5,000 mortgage on
15 my house for my mother-in-law or something,
16 instead of having her put them in Hydro bonds.

17 Mortgages are tending to become a
18 funny piece of paper that people no longer like.

19 COMMISSIONER BROWN: I think part of
20 that is the fact that monthly payments are not
21 always convenient for the private lender.

22 MR. CAMPBELL: Yes.

23 COMMISSIONER BROWN: And this is
24 developing in this country because of the problem
25 of monthly payments during the term of the mortgage
26 which did not exist 25 years ago.

27 MR. CAMPBELL: Yes, and that is one of
28 the new functions for existing financial institu-
29 tions which I advocate, is that, being large, they
30 can issue series paper or tailor or adjust any

1 pieces of paper out of the mortgage to fit various
2 interest requirements.

3 COMMISSIONER BROWN: This brings up my
4 next point that if this corporation is created
5 and then issues this paper, this paper has to
6 be issued in competition with your hydro bonds.

7 MR. CAMPBELL: Yes.

8 COMMISSIONER BROWN: Or Bell Telephone
9 and other companies are also trying to compete
10 for that type of money.

11 MR. CAMPBELL: Yes.

12 COMMISSIONER BROWN: What is going to
13 fill the gap that is going to be created there?

14 MR. CAMPBELL: It is just going to
15 re-establish competition in the whole market
16 of all of the people who want money, instead of
17 removing the housing outside of it.

18 COMMISSIONER GIBSON: Could we get at
19 this more clearly by having your ideas as to
20 what created this gap? How do we come to get
21 this great gap in housing finance that every-
22 body talks about?

23 MR. CAMPBELL: Well, one of the points
24 has been raised, and that is the fact that we
25 have for collection purposes, we have changed
26 our mortgage repayments from half yearly and
27 annually to monthly on blended payments for
28 collection ease. So we now have an investment
29 which is perhaps suitable for pension funds and
30 life companies but perhaps not the rest of the

1 market.

2 COMMISSIONER GIBSON: There must be
3 something more fundamental than that behind this
4 thing.

5 MR. CAMPBELL: Sure, there are lots
6 of things, I think, which are fundamental behind
7 it. It is the difficulty in the expertese re-
8 quired in creating mortgages, knowing what you
9 are doing, having confidence.

10 I think I said in my brief that in-
11 vestment dealers are excellent in selling bonds.
12 It does not make them mortgage experts any more
13 than it makes a bank manager a mortgage expert.

14 I say, difficulty in creating the
15 mortgages. With so many dollars required for
16 new construction, the investor is afraid because
17 he is not a bricklayer or builder, and he is
18 afraid to go into a new situation.

19 You have the fact that interest rates
20 do vary on mortgages, they are a higher rate,
21 and the uncertainty of the length of your in-
22 vestments as compared with competitive invest-
23 ments.

24 COMMISSIONER GIBSON: Well, all those
25 things existed before. Do you subscribe to the
26 theory that is quite frequently put out, that
27 savings have tended over the last generation to
28 become institutionalized, and that a lot of the
29 mortgage financing used to be done by lawyers and
30 so on and this does not happen very much and the

1 institutions are not yet ready to move fully into
2 this. Is this a sensible view of the situation?

3 MR. CAMPBELL: Yes, this is not unusual
4 that savings tended to become institutionalized
5 but mortgage funds tend to go into the institutions
6 instead of to mortgages because of a recognition
7 of the expertese in making the loan as well. I
8 mean, it is the combination of a number of
9 factors. It has developed though.

10 THE CHAIRMAN: Can you give me any
11 indication as to the extent to which mortgage
12 business which, 20 or 30 years ago was carried
13 on through solicitors' offices, has decreased?
14 Do you know that?

15 MR. CAMPBELL: No, sir. I am 37.

16 THE CHAIRMAN: Well, the great back-
17 bone of many solicitors' offices at that time
18 was the mortgage business which they transacted
19 for clients who had small amounts of money and
20 could put it out on mortgages, even if they were
21 doing it through an institution. I wondered
22 where that sort of money goes today? Has that
23 sort of business been increasing with the increase
24 of population and wealth or is it dying out?

25 MR. CAMPBELL: Well, this is not from
26 personal experience, because we are pretty far
27 removed from this, and besides, as I said, I am
28 younger, so I do not have a lot of older, dead
29 clients and estates. But I do know that a lot of
30 funds still remain with lawyers for investment,

1 but lawyers in their investment approach have tended
2 to become institutionalized too, and perhaps some
3 of them have put funds, where they have the power
4 to do so, in second mortgages or the odd first
5 mortgage on the family homestead which is being
6 sold, but more and more they tend to use the ser-
7 vices of the investment dealers and not take the
8 risks themselves of making a mortgage investment.

9 THE CHAIRMAN: So that a great deal of
10 that money which used to come into mortgages, no
11 doubt goes into something today but perhaps not
12 mortgages, is that it?

13 MR. CAMPBELL: Yes, Hydro bonds.

14 COMMISSIONER LEMAN: Mr. Campbell, you
15 seem irked by this gap and you ascribe a great
16 deal of the reason for its existence to the
17 technical field. Now, I would like to ask some
18 questions in another form. Suppose that someone
19 had tried to put a lot of money into the consumer
20 durable goods market at $6\frac{1}{2}$ per cent to the borrower
21 in the last five years. Don't you think you would
22 have created a big gap in that market too?

23 MR. CAMPBELL: Yes.

24 COMMISSIONER LEMAN: So I am wondering
25 if it is not partly a disregard for market forces,
26 besides the technical obstacles that has created
27 the gap.

28 MR. CAMPBELL: Well, I am sure the market
29 forces are partially responsible. The market forces
30 are things which are different tomorrow than they

1 were yesterday, and these market forces about which
2 we speak are things that have grown over a period
3 of time.

4 I am suggesting that we try to amend
5 them somewhat, and perhaps it is just as simple
6 as some of these technical things, so that there
7 is a general ability to compete for the available
8 funds.

9 COMMISSIONER BROWN: Would an increase
10 in rates accomplish it?

11 MR. CAMPBELL: I don't think so.

12 COMMISSIONER BROWN: Would an increase
13 help to close that gap?

14 MR. CAMPBELL: That is a different
15 question. Help to close the gap, yes, but an
16 increase in rates, in my opinion, alone would not
17 close the gap.

18 COMMISSIONER BROWN: Would it make
19 them more competitive in this competitive market?

20 MR. CAMPBELL: Well, we start now to
21 go around in a circle. I think that an increase
22 in rates would help to close the gap, and people
23 would make the investments, but they would shy
24 away from making too many because the loans are
25 prepayable and they would lose their good invest-
26 ment in favour of some other longer term invest-
27 ment available at slightly less rates.

28 COMMISSIONER GIBSON: I ask you one of
29 your own questions. Is a free interest rate on
30 N.H.A. mortgages feasible? Would you comment on

1 MR. CAMPBELL: I feel that it is most
2 desirable, but that it is only feasible if there
3 is a large volume of capital available to compete
4 for investment in N.H.A. mortgages.

1
2
3 I think it is something that could be accomplished
4 rather rapidly. The effective results of the system
5 obtaining under the F.H.A. for mortgages in the
6 United States is the free interest rates, and this
7 tends to make more mortgage money available in the
8 United States than is available in Canada. It does
9 not overcome the whole problem, but it certainly
10 tends to, and this is most desirable, to have the
11 market sensitive to interest rates, and I think,
12 in my opinion, that the N.H.A. mortgage rate should
13 be free just immediately upon the private capital
14 market furnishing the N.H.A. requirements in any
15 given short period of time.

16 COMMISSIONER GIBSON: You don't think
17 this would tend to cost the people benefitting from
18 N.H.A. mortgages any more than the present system?

19 MR. CAMPBELL: There would be bound
20 to be initial and from time to time minor dislocations,
21 but in the long run it would save them money, not
22 cost them money.

23 COMMISSIONER LEMAN: As an example
24 of the stickiness of rates, etc., in that field,
25 would you visualize or even recommend, for instance,
26 the C.M.H.C. selling mortgages at 94 -- at a discount?

27 MR. CAMPBELL: Well, I don't think C.M.H.C.
28 should have as many mortgages to start with to be
29 selling, and government selling at a discount without
30 the intention to re-invest and upgrade their portfolio
is different from a bank or life company doing the
same thing. Perhaps it is the function of government
to subsidize the housing industry in this indirect
way of taking losses on their mortgage investments.

1
2
3 I don't think they should be re-investing to protect
4 their yield. I think they should be performing
5 their function of -- well, the function we have grown
6 to expect from them as being one of the main
7 assists in our sociological requirements.

8 COMMISSIONER LEMAN: You would not go
9 further than just to say "perhaps"?

10 MR. CAMPBELL: Sure, I think they should.

11 COMMISSIONER LEMAN: You think they should?

12 MR. CAMPBELL: Yes. I think they should
13 still get the best price obtainable at any time.

14 COMMISSIONER LEMAN: This has not been
15 done yet, has it?

16 MR. CAMPBELL: I think they have been
17 very careful in the way they have been marketing
18 their mortgages, and they haven't exposed themselves
19 to this criticism which would be bound to flow in
20 on them.

21 COMMISSIONER LEMAN: Is that another
22 field of unsophistication?

23 MR. CAMPBELL: On the part of the people
24 that criticize.

25 THE CHAIRMAN: There are no further
26 questions? I wish to thank you very much for your
27 presentation, Mr. Campbell; we are very much
28 interested.

29 MR. CAMPBELL: Thank you for the opportunity,
30 Mr. Chairman.

THE CHAIRMAN: We shall now adjourn until
2.15 P.M.

--- Luncheon Adjournment.

--- On resuming at 2.15 P.M.

THE CHAIRMAN: The Commission will now resume:
Urban Development Institute; Mr. MacDonald?

SUBMISSION OF URBAN DEVELOPMENT
INSTITUTE
ONTARIO DIVISION

APPEARANCES

Mr. Alan J. Scott	-	Past President
Mr. D.G. MacDonald	-	President
Mr. H.K. Morley	-	Vice-President
Mr. Alec K. Dixon	-	Executive Director

MR. MacDONALD: Mr. Chairman and members of the Commission, in my opening remarks I would like to thank the Commission for the opportunity of appearing here today and presenting our views. I would like also to give you a very quick run-down as to what the Urban Development Institute is.

The Urban Development Institute (Ontario Division) is an association of active land developers in the Province of Ontario. The institute was formed in 1957 in recognition of the fact that the providing of land for housing at a price within the means of the average person, has become a serious social problem. One of the major difficulties in the solution of this problem has been the lack of a single recognized channel of communication between land developers and municipal and other levels of government so as to permit greater understanding and cooperation in mutual problems.

In order to be more representative of firms and companies engaged in land development in Ontario, the Institute accepts as associate members certain selected firms in the fields of subdivision engineering and town planning. The Institute is thus able to speak with a single voice in the interest of better understanding with the various levels of government, to ensure closer cooperation in all matters affecting land development.

Statement of Policy: In march of 1960 the Urban Development Institute (Ontario Division) received its Provincial Charter as a non-profit organization, having the following aims and objectives:

(1) to promote well planned communities by encouraging the reasonable and economic use of land.

(2) to promote efficiency and a high standard of ethics among persons and corporations engaged in land assembly and development.

(3) to promote understanding and co-operation between persons and corporations engaged in land assembly and development, and municipal planning, and other government authorities and agencies.

(4) to promote the availability of building lots at the lowest possible cost.

(5) to promote revisions in the tax structure so that land alone would not be required to produce the revenue necessary for educational and social services.

Now, a brief definition of a land developer: A land developer is a person or individual who buys land and manufactures building lots. He invests his money in the land and sewers, water and

1
2
3 various services and markets a commodity in the
4 market.

5 Mr. Chairman, on page 1 of our submission,
6 Item No. 2, we have a summary of our recommendations,
7 five in number. With your permission, Mr. Chairman,
8 I would like, before going into these five recommend-
9 ations, to say that if you have had an opportunity
10 to study these recommendations it must have occurred
11 to the members of the Commission that there is a
12 very basic recommendation which is longer term in
13 nature which does not appear here. This, we presume,
14 will be stressed very strongly by the representatives
15 of the municipalities which appear before you, and
16 this is the necessity for an immediate beginning
of a detailed study on revision of the tax structure in
Canada.

17 THE CHAIRMAN: Well, of course, we are
18 not concerned with that so much in this Commission.
19 I think you will have to confine yourself to your
20 brief. We have read the brief, and if there is any
21 material that should have been put in it, it should
22 have been before us so that we would have had a chance
23 to consider it. I would suggest you continue with
the brief and then leave it open to us to ask questions.

24 MR. MacDONALD: Mr. Chairman, that is
25 my intention. I was not going to proceed any further
26 with this particular point, and if there are any
27 questions we will be prepared to develop them later.

28 THE CHAIRMAN: It may be that some members
29 may decide to ask questions on that point.

30 MR. MacDONALD: Thank you, sir. Our five
recommendations appearing in this brief, Mr. Chairman,

break down into two sections. By reason of the fact that our membership is basically land developers, but also includes land developers and builders, you will note that recommendations 1, 2 and 3 refer to N.H.A. loans and mortgages in general, whilst recommendations 4 and 5 have a more direct connection with land development.

Recommendation No.1: "That the down payment for N.H.A. loans be reduced through an increase in the maxima by regulation and an increase in the percentage of loan to binding value. Similarly, a further change in the Insurance Act should be made to permit conventional mortgages in excess of the current 66-2/3 per cent of lending value.

We realize on this particular point there are dangers in going to extremes both in the amount of these loans and the term, but particularly we feel very strongly in regard to the increasingly present maximum of 66-2/3 per cent on conventional mortgages.

Recommendation No. 2: "That to reduce the carrying charges on N.H.A. loans, consideration should be given to an effective extension in the amortization period."

I would like to emphasize the word "effective". At the moment I believe the maximum term under the National Housing Act is 30 years, but this is not an effective term because many of the mortgage companies -- I think the majority -- do not write their mortgages to the maximum term of 30 years.

Recommendation No. 3: "That the Bank Act be amended if necessary to permit the chartered

- 1269 -

banks to participate directly in N.H.A. lending activity without regard to the current 6 per cent interest limit."

We do not know, first of all, if the Bank Act has to be amended. If it is not a requirement, or if the Bank Act was amended, we do not know how much N.H.A. lending would come out of this, but at least the opportunity is there.

Recommendation No. 4: "That municipalities be permitted to borrow capital funds through the National Housing Act in order to install other municipal services in addition to trunk sewers and sewage disposal plants, on a local improvement basis repayable through taxes."

The legislation was passed under the National Housing Act approximately two years ago providing for N.H.A. financing of trunk sewers and sewage disposal plants at the N.H.A. rate of interest but with the remission of 25 per cent of the work completed before March, 1963. We are suggesting this could be extended to include auxiliary sewers.

Recommendation No.5: That consistent long-term federal government policies with respect to the financing of land development and housing be devised so as to ensure a healthy and continuing investment climate." Thank you.

COMMISSIONER LEMAN: Mr. MacDonald, in your statement of policy -- or, at least in your Appendix A, you say that the providing of land for housing at a price within the means of the average person has become a serious social problem.

1 When did it become so? Is this a recent worsening
2 of the situation, or is it a long-term view you
3 have taken.

4 MR. MacDONALD: This is relatively long-
5 term; I would say over the past eight years, Mr.
6 Leman. I would say about eight years ago the Subdivision
7 agreement -- what is commonly termed the subdivision
8 agreement in the trade -- came into effect. Before
9 this came into effect municipal services such as
10 sewers, water, roadways etc., were installed under
11 the Local Improvement Act by the municipalities.
12 Because of the problems which the municipalities
13 began to feel eight or ten years ago with the
14 mushrooming growth and the resources they had to
15 meet these problems, the policy was changed. It
16 began in Toronto and spread throughout Ontario, and
17 then Canada, whereby the developer put in at his
18 own cost all these internal services -- sewer,
19 water, roadways, etc., and of course these costs
20 were passed on to the house purchaser. You will say
21 that whether the developer did it or the municipality
22 did it, the cost was nevertheless there. That is
23 true. There are two points involved here: When
24 the municipality did it under the Local Improvement
25 Act approximately 25 per cent of the cost of this
26 was carried by the general taxes, and 75 per cent
27 applicable to the abutting property. In other words,
28 the Municipal Act envisaged that there was a benefit
29 to the whole community to the extent of 25 per cent
30 of the total cost of the expansion of the community.
When the Subdivision Agreement came into effect
the home owner carried 100 per cent of the cost
of all these services.

There is another point that comes into

1
2
3 this now: When the municipality brought this
4 Subdivision Agreement into effect whereby the
5 developer, and hence the house purchaser, was paying
6 these services in total, the municipality was still
7 in the position of dictating what services and what
8 standard of services would go in. When this
9 developed you lost the checks and balances system
10 that you had in the past whereby the engineering
11 department had to satisfy the treasury department
12 as to what monies were being expended, and we
13 contend that it is human nature that when you have
14 an engineering department or a municipality that is
15 not paying any of the cost of this, or do not have
16 to find the money for these services, that the tendency
17 is -- put it conversely: There is no great pressure
18 to keep this to a reasonable minimum, and this is
19 another point I say has increased costs. The standards
20 have gone up of servicing land. I would say there
21 are two points: No longer does the general tax
22 rate carry 25 per cent of the cost of servicing these
23 properties, and secondly, engineering standards
24 have risen considerably.

25 COMMISSIONER LEMAN: But under the old
26 system didn't some municipalities get caught with
27 extension of services that had been ill-timed?

28 MR. MacDONALD: I would agree that has
29 happened, very definitely. We have a subdivision
30 in Hamilton developed in 1912 that has just been
built upon in the last two or three years.

COMMISSIONER LEMAN: So there was a
reason for this basis of doing things?

- 1272 -

Mr. MACDONALD: There was a reason, very definitely: It is the economic problems of the municipality, Mr. Leman.

COMMISSIONER LEMAN: To deal directly with the first recommendation you make, in that field due to the National Housing Act there has been an improvement over what it was before: The amount of down-payment that people have to put down, and the price of houses -- in effect, you are saying it has not gone far enough; is that it?

MR. MacDONALD: That is right, sir.

COMMISSIONER LEMAN: By the way, is the maximum 30 years, or is it 35 years?

MR. MacDONALD: It is 35. I said 30, and I was corrected by my colleague.

COMMISSIONER BROWN: On the basis of 35 years now, how long extension would you have to have in order to get any effective reduction in the carrying charges?

MR. MacDONALD: In the wording of that recommendation, sir, I think we say that to reduce the carrying charges of N.H.A. loans, consideration should be given to an effective extension. How this is done, I don't know.

COMMISSIONER BROWN: You must have looked at amortization tables of some kind to come up with this recommendation: How effective a reduction do you want -- how long a period would it be necessary to get the extension for to get that reduction?

MR. MacDONALD: What I am trying to say is that we are quite happy with the 35 years if it is effective, but the private mortgage companies

Toronto, Ontario

- 1273 -

1
2
3 in the main -- I would venture to say that 80
4 per cent of the mortgage loans are made on 25 years
5 rather than 35.

6 COMMISSIONER BROWN: This must be the
7 pressures of the market, then.

8 MR. MacDONALD: It very well could be,
9 but we are quite happy with 35 years.

1 THE CHAIRMAN: Perhaps the mortgage
2 companies are right to cut it down to 25 years.
3 Why do you think that it should be 35? What is
4 the advantage of 35? It means that the average
5 monthly payment is a little bit less but not
6 so very much less.

7 MR. MacDONALD: I do not have the
8 tables with me, Mr. Chairman, but I would say
9 this, and that is, that public housing and
10 limited dividend loans are amortized up to 40
11 and in some cases up to 50 years by the federal
12 government.

13 THE CHAIRMAN: Isn't it better for the
14 person to own his house at the earliest possible
15 moment instead of dragging it out and the
16 difference between the monthly payments on the
17 one basis is very little from the other? You will
18 find that it is a very little difference.

19 MR. MORLEY: At that particular level
20 of income it may bring in a very large number of
21 people. A very large proportion of wage earners
22 are in that bracket and to lengthen the term of
23 the mortgage reduces the monthly payments
24 sufficiently to induce a very considerable number
25 of buyers.

26 THE CHAIRMAN: Have you any figures?

27 MR. MORLEY: I am afraid we have not.

28 THE CHAIRMAN: Take a sample house at
29 so many thousand dollars, where does it work out?
30 What is the difference, the sort of house that

1 might be bought by the average working man?

2 Perhaps someone could work that out while we
3 continue with the discussion to save time.

4 MR. MORLEY: We really represent the
5 land development industry. This is getting into
6 the house building field which, of course, is
7 of very real interest to us but we do not have
8 that kind of figure available.

9 THE CHAIRMAN: But you are proposing
10 that the term of payments should be extended.
11 That is one of your points and I am not so sure
12 that this is a sound point myself.

13 COMMISSIONER LEMAN: Mr. MacDonald,
14 have you answered the Chairman's question?

15 MR. MacDONALD: Well, we do not have
16 figures. He has asked for figures and we do
17 not have them at the moment.

18 COMMISSIONER LEMAN: Do you have any
19 evidence (still within recommendation number
20 one) - do you have any evidence that the insurance
21 companies would want a lower down payment and
22 higher than 66 and two-thirds per cent mortgage
23 on conventional business?

24 MR. MacDONALD: The evidence which I
25 have is purely personal, sir, but in talking with
26 officials of various mortgage companies I have a
27 strong indication that in many cases they would
28 go beyond the 66 and two-thirds per cent.

29 THE CHAIRMAN: Well, they do not go to
30 the limit now in most cases, do they?

1 MR. SCOTT: Well, sir, if I may add
2 to that, in certain areas it would seem that the
3 appraisals on homes are over-appraised so that
4 they can stretch this as far as possible in cer-
5 tain areas. It would also seem that if this
6 were increased it would cut out some of the less
7 satisfactory second mortgages and it would also
8 seem that the older housing where a family
9 would like to move into more quickly they could
10 more easily move into older housing whereas at
11 the present time they are forced through economic
12 circumstances to move a long way out and to take
13 the lowest down payment under the N.H.A. scheme
14 which would allow a ten per cent down payment
15 and this may lead to an urban sprawl because of
16 the lower cost when one gets further out of the
17 metropolitan area.

18 COMMISSIONER LEMAN: There is a question
19 of leading a horse to water and making it drink.
20 Those are two different problems. You point
21 out too that on the 35 year effective amortization
22 period you find that they do not go to the 35,
23 those lending on N.H.A. lands and now what we
24 are asking you here is - we are not arguing about
25 the desirability of doing it but evidence that
26 the insurance companies would want to go further.
27 Is there evidence?

28 MR. MORLEY: I think there is very
29 little evidence but that is the case. There is
30 United States money being lent in Canada now up

1 to 75 per cent. I am not familiar with the
2 reasons for this but I know in general terms
3 that it is permissible under the United States
4 legislation and it is actively being loaned now
5 and that other companies who are only allowed
6 to loan up to 66 and two-thirds per cent have
7 expressed, privately anyway, the wish that they
8 could go that far and I think as someone else
9 said by higher appraisals this effect is being
10 achieved.

11 COMMISSIONER BROWN: Presumably if
12 this is so we will be having representations
13 from these people.

14 MR. MORLEY: I would have thought so.

15 COMMISSIONER BROWN: They are the ones
16 to make the representations.

17 MR. MORLEY: It could be so.

18 COMMISSIONER BROWN: Going back to this
19 first recommendation again:

20 "THAT the down payment for N.H.A.
21 loans be reduced through an increase
22 in the maxima by regulation and an
23 increase in the percentage of loan to
24 lending value."

25 What sort of figures are we talking about? How
26 far do you want to go? You want an increase from
27 the present. How big an increase are you
28 thinking in terms of?

29 MR. MacDONALD: The present maximum,
30 I think, is 14.8 on a three bedroom house.

1 MR. MORLEY: I think it is possibly easier
2 to think of this from the point of view of the
3 down payment particularly in the metropolitan
4 areas. It is extremely difficult to produce a
5 house today in a metropolitan area such as Toronto
6 on fully serviced land requiring a down payment
7 as low as \$3,000. It is extremely difficult,
8 a detached house. It is more normal for \$4,000
9 to be called for.

10 COMMISSIONER BROWN: How expensive
11 a house is this?

12 MR. MORLEY: Say \$17,000 - \$17,000 or
13 \$18,000 and it would seem more desirable to
14 approach 15 per cent equity than as it often is,
15 20 or 25 per cent.

16 COMMISSIONER BROWN: You do not think
17 that somebody who is building that expensive a
18 house should not be able to pay down more than
19 15 per cent?

20 MR. MORLEY: It is very nice if it can
21 be done but normally there are so many other
22 attractions for using that money before it is
23 saved up.

24 THE CHAIRMAN: I suppose there are not
25 many new houses you can buy for less than \$17,000
26 in the Toronto area?

27 MR. MORLEY: No, there are very few.

28 THE CHAIRMAN: Is that so?

29 MR. MORLEY: Yes.

30 COMMISSIONER LEMAN: Do you think there

1 might be a danger that with all these so-called
2 improvements for the house owner you would end
3 up by making house ownership over a period cheaper
4 than renting the same accommodation by causing
5 the borrower to have such a low equity or
6 building up an equity in his house so slowly
7 that you would run into irresponsible behaviour?
8 Isn't there a little evidence that you can run
9 into this? I think in the States they may have
10 had some indication that there are practical
11 limits. If you go beyond those limits you do
12 run into such behaviour.

13 MR. MORLEY: Yes, I would agree there
14 is a danger but at present we are a long way
15 from it in the urban area. We are getting back
16 20, 25, 30 per cent or even 33 and a third per
17 cent in the case of a conventional loan and that
18 is we would think sufficiently safe to allow
19 of reduction and it reduces the danger of
20 the second mortgage method of financing which
21 is much more vicious.

22 COMMISSIONER LEMAN: I was referring
23 mainly to the N.H.A.

24 MR. MORLEY: Even second mortgages enter
25 into the N.H.A. operations.

26 COMMISSIONER LEMAN: Then that comes
27 back to Mr. Brown's question, what are the limits
28 you would recommend of both types?

29 MR. MORLEY: I would think that it is
30 too complex to give a categorical answer on this

1 because there are so many factors involved by
2 virtue of different locations and values but I
3 would in general terms say that a 15 per cent
4 equity should be adequate and should be aimed
5 at.

6 THE CHAIRMAN: What percentage was that?

7 MR. MORLEY: 15 per cent.

8 THE CHAIRMAN: Well, one of the diffi-
9 culties is that you reduce now the equity and
10 then the prices go up. Very often they tend to
11 rise as the result of that?

12 MR. MacDONALD: That would be so if
13 there were only first mortgage financing but I
14 think what more often happens is that a second
15 mortgage is entered into and the purchaser may
16 only put ten per cent equity in and may borrow
17 66 per cent by first mortgage and the balance
18 by second mortgage which is much more expensive
19 and much more onerous. We do not suggest that
20 this is a simple problem.

21 THE CHAIRMAN: Well, the N.H.A. has
22 already made a reduction some time ago and I
23 suppose now the spread is greater because of higher
24 costs in building houses?

25 MR. SCOTT: Perhaps it is not a case of
26 building houses that is the trouble here so much
27 as the provision of the land for them with the
28 additional funds.

29 THE CHAIRMAN: Well, I would add that,
30 yes.

1 COMMISSIONER BROWN: If there is a greater
2 demand for these houses by making it easier for
3 people to buy then there would be more competition
4 for the land and the price of land certainly does
5 not get any cheaper under those circumstances.

6 MR. SCOTT: This depends upon what
7 trunk servicing had been carried out by municip-
8 alities to ensure there was not a monopoly in
9 one area.

10 COMMISSIONER BROWN: Then the costs of
11 service would go up?

12 MR. SCOTT: The cost of servicing
13 necessarily must come in advance of development
14 of the land and in many cases it has been left
15 to the developers to do this rather than tradi-
16 tionally by the municipalities over the last few
17 years and this recent change in the N.H.A. which
18 has made moneys available to the municipalities
19 has been a great help in stabilizing the cost of
20 raw land.

21 COMMISSIONER BROWN: In Appendix B
22 that you have, is a copy of a resolution, and I
23 was wondering if you could clarify it for us.
24 The resolution reads after a lot of "whereases":

25 "THEREFORE BE IT RESOLVED:

26 (a) The sale of Federal-Provincial land
27 by public tender, auction or some other
28 basis calculated to result in a proportion,
29 at least, of the profit involved in these
30 operations being realized, would result

1 "in sufficient funds accruing to the
2 Federal Government to finance the
3 proposed installation of trunk ser-
4 vices in the municipality in which
5 the Federal-Provincial Land Assembly
6 has taken place."

7 Now, at first reading that sounds as though you
8 recommend selling these lands by auction because
9 thereby you get a higher price for it or the
10 government would get a higher price for it and
11 this profit would be available for other land.
12 This sounds a little contradictory because it
13 sounds as though you are trying to get a higher
14 price for the land in order to get land cheaper?

15 MR. SCOTT: There have been acquisitions
16 of land principally, I think, in 1954 in this
17 province by the Federal-Provincial Partnership
18 and these lands, except in a few locations, have
19 remained undeveloped either because one of the
20 two partners or the municipality has not wished
21 to go ahead with that development. There has
22 been no demand for it and at the time of this
23 resolution which was presented to the Minister
24 of Works - and I believe this had some bearing
25 on the provision of funds for trunk services -
26 we were looking for a place to say to him: "If
27 you sell these lands then you can build trunk
28 services, the trunk services which would keep
29 raw land prices down which was the object of
30 putting together this Federal-Provincial Land

1 Assembly scheme. But then you sell this off and
2 you would expect trunk service, sell it at the
3 highest price and then the municipality might
4 spend the money in various trunk services and we
5 will proceed and the inter-governmental differences
6 may thereby be resolved."

7 MR. MacDONALD: I think, to add to Mr.
8 Scott's remarks, that it is our feeling that
9 like any other commodity the more stock you have
10 on the shelf the lower the price will be and
11 the greater the competition. And we think the
12 greatest factor in keeping land prices down is
13 the presence of trunk sewers; in other words,
14 there is serviceable land available and it is
15 on the shelf, so to speak, and more competition
16 is developed. The reverse situation is where
17 one developer builds his own trunk service and
18 one developer has the cash to extend the trunk
19 service to his own piece of land and he has a
20 monopoly and you lose all competition.

21 COMMISSIONER LEMAN: Isn't what you
22 have just described the mechanism which tends to
23 raise raw land as well as serviced lands?

24 MR. SCOTT: That is right, sir.

25 THE CHAIRMAN: I don't know whether I
26 quite understand it or not but is the effect of
27 what you say that if trunk sewers are put in over
28 the whole area where the land is undeveloped
29 then each lot in that whole area will be less
30 expensive because there is not a small monopoly of

1 trunk sewered land in one portion of the area?

2 MR. MacDONALD: We say extended within
3 reasonable limits.

4 THE CHAIRMAN: Yes, but there should
5 be laid out a development looking ahead perhaps
6 for a considerable time when the trunk sewers
7 are installed but otherwise if it is developed
8 piecemeal you have to put in a trunk sewer here
9 and a trunk sewer there and it may be developing
10 a problem and be more expensive. And the other
11 effect of it, as I understand you, is that if
12 the trunk sewer is only put into a small section
13 to begin with that puts that developer into a
14 sort of monopoly position as the owner of trunk
15 sewered land. On the other hand, if another
16 developer wanted to develop property next door
17 he could put in a trunk sewer of his own, I
18 suppose.

19 MR. SCOTT: This would appear on the
20 face of it - this is true generally but you have
21 certain limits to where your sewage plants are and
22 where your trunks come out. You get to a point
23 where because of the --

24 THE CHAIRMAN: Well, I think I see the
25 point. I can see the value of that.

26 MR. SCOTT: This would also, sir,
27 apply if one could extend that type of policy
28 to other services which would benefit the muni-
29 cipality. I don't know if it is in order for me
30 to expand on the fourth item, sir, because that

1 is the one where we talk about the trunk sewers,
2 sewage disposal plants, etcetera.

3 THE CHAIRMAN: Now, they can borrow for
4 trunk sewers only, is that right?

5 MR. SCOTT: That is correct, sir.
6 Through the N.H.A. they may borrow for trunk
7 sewers and this has helped very considerably be-
8 cause they are able to borrow at a better rate
9 than they would otherwise be and they can then
10 keep ahead with services. Now, if it were possible
11 to extend these other municipal services then the
12 municipalities would have overcome certain of
13 these major problems of expansion that they have.

14 This extends particularly, of course,
15 to their main expense today being in education
16 and that is taking so much of their budget that
17 anything that will help any other phase is
18 extremely helpful.

19 COMMISSIONER LEMAN: Mr. MacDonald, in
20 your paragraph eight in your brief there seems
21 to be a hint there that you would like the flow
22 of funds for residential construction to be in-
23 sulated from monetary policy. Is that really
24 your suggestion?

25 MR. MacDONALD: To the extent yes, that
26 the housing business - and by that I include the
27 development business to some extent - has been
28 an economic tool, I guess is the best word,
29 used by the government as an economic tool. This
30 creates a situation whereby builders find it very

1 difficult to plan ahead, developers find it very
2 difficult to plan ahead. You have a very fluctu-
3 ating mortgage situation. At the present time
4 most companies have money coming out their ears,
5 to use the vernacular. By this time next year
6 the situation may be reversed and if we are
7 going to make progress in housing I think the
8 progress is going to be in the field of in-
9 dustrialization and until this problem is
10 overcome it is very difficult for builders to
11 make much capital investment in order to improve
12 methods of building houses and take advantage
13 of industrialization generally.

1 COMMISSIONER LEMAN: On the other hand,
2 Mr. MacDonald, what would you say is the present
3 situation? Is there a shortage of housing or
4 is there a little bit of over-capacity right
5 now?

6 MR. MacDONALD: I would say at the
7 moment there is a bit of over-capacity as of
8 today. I will qualify that by saying in a price
9 bracket over and above \$17, \$18,000.

10 COMMISSIONER LEMAN: Do you subscribe
11 to the opinion of certain people to the effect
12 that construction is one of the biggest factors
13 in the cycle in creating demand for goods and
14 services?

15 MR. MacDONALD: I would certainly
16 subscribe to that.

17 COMMISSIONER LEMAN: Therefore is it
18 not a little bit dangerous to say "let us
19 insulate it from the effects of monetary policy"
20 if it is such a large factor in the whole?

21 MR. MacDONALD: I would answer your
22 question by saying that it is a matter of degree.
23 I think we would like to see it less exposed
24 than it is at the moment and has been over the
25 last 15 years.

26 COMMISSIONER BROWN: Everyone wants
27 that.

28 THE CHAIRMAN: Is not one of your problems
29 then that in certain times there is a very great
30 demand for housing, and there are a great deal of

1 houses built -- some of them are not too well
2 built in those periods -- and then there is a
3 temporary over-supply, and that all contributes
4 to the cycle, it contributes to the situation
5 which leads to some brakes being applied by the
6 central bank? On the other hand, could you
7 suggest or recommend that something be done to
8 reduce the number of houses built during the
9 boom period so that there would be an even
10 supply of houses being built gradually, perhaps
11 more from year to year as the population increases.
12 Is that a practicable possibility at all?

13 MR. SCOTT: Sir, I think that the
14 effect of the sudden placing of direct mortgages
15 when there is a period of unemployment, does
16 not necessarily coincide with the need for that
17 extra amount of housing.

18 The location of this housing that
19 appears with direct N.H.A. loans when they are
20 suddenly placed in large quantities, is not
21 always the best for the industry as a whole or for
22 the planning as a whole, because they tend to go
23 in very outlying areas, a large proportion of them,
24 that is.

25 COMMISSIONER LEMAN: How would you go
26 about trying to regulate the whole situation?

27 MR. SCOTT: We are just trying to point
28 out some of the problems that are there. The
29 solution is not as simple as all that.

30 THE CHAIRMAN: We would like to have

1 recommendations from those people who are in the
2 business and are presumed to know.

3 MR. MORLEY: We would rather have the
4 decisions taken by those that are affected, the
5 mortgage lenders as they see the market and the
6 builders themselves.

7 MR. MacDONALD: Just as an illustration,
8 Mr. Chairman, of Mr. Scott's point, I do not like
9 to localize things but I will go back to the
10 City of Hamilton where I think about three years
11 ago there was a great amount of money put out
12 by the C.M.H.C. in the form of direct loans.
13 One particular subdivision where one of the mort-
14 gage companies that we deal with have about ten
15 lots in the subdivision of 50 lots, they have
16 something like eight houses unsold, and the
17 remaining 40 lots were entirely built up under
18 direct loans from the Federal Government through
19 C.M.H.C., and the mortgage company involved,
20 with its eight unsold houses, their difficulties
21 were increased eightfold or whatever the proportion
22 is.

23 COMMISSIONER LEMAN: Are you suggesting
24 that for a private builder to go into an area
25 where another builder has made inroads to a great
26 extent is a dangerous proposition, that he should
27 not work in the same area?

28 MR. MacDONALD: Basically I think it
29 could be summed up by saying - and I think this
30 is the consensus of this Institute - that government

1 is best out of the direct loan field, except for
2 outlying areas which are not serviced by the
3 recognized lending institutions; because they
4 come in and they disturb the normal market
5 working and create periods of great surplus.

6 COMMISSIONER MACKINTOSH: Then really
7 what you want is to let the cycle take its
8 course?

9 MR. MacDONALD: That is right.

10 THE CHAIRMAN: By reducing the down
11 payments are you not interfering with the
12 effective operation of the cycle?

13 MR. MORLEY: By increasing it we are
14 intefering with the cycle?

15 THE CHAIRMAN: By decreasing the
16 down payment.

17 MR. MORLEY: I would suggest by not
18 decreasing we are interfering.

19 THE CHAIRMAN: Well, I suppose the time
20 always comes when the market is exhausted, and
21 perhaps if you reduce the down payments it might
22 extend the time a little bit, but that is about
23 all.

24 MR. SCOTT: Sir, it becomes a question
25 of where a family earning a certain salary is
26 going to live, and whether it can afford to move
27 into the areas under the present conditions. I
28 am afraid that we are referring largely to the
29 metropolitan areas where this problem exists.

30 They either go into the older homes where

1 they must have a first mortgage which can only go
2 to 66 and two-thirds per cent and then make such
3 secondary arrangements as they can, or they have
4 to go into the outlying areas with the minimum
5 as it is at the present time, the minimums be-
6 coming very high in these metropolitan areas.

7 That is why we are suggesting that there
8 is a large population which is not covered, does
9 not have the opportunity to move into single
10 family homes.

11 MR. MacDONALD: On that very point,
12 Mr. Chairman, I would just like to enlarge upon
13 it and say that I am on the Urban Renewal
14 Committee in the City of Hamilton, and we feel
15 that in connection with this increase of the 66
16 and two-thirds per cent conventional loans, that
17 a lot of the work which our body is presently
18 doing on the selected area in the City of Hamilton
19 could not be done otherwise than this particular
20 area, because once an area is designated there
21 is a blight put on it; but in adjacent areas
22 which may be declared urban renewal areas with a
23 lot of subsidies in the nature of write-down of
24 land values which amounts to 50 to 80 per cent
25 of land values on the average, could be avoided
26 by the development of reasonably high conventional
27 mortgages and N.H.A. mortgages on used homes.

28 I think this would offset, would
29 bring about a situation where redevelopment
30 could occur through private interests and avoid

1 the great subsidies which are presently going into
2 this urban renewal.

3 COMMISSIONER BROWN: Are you not in
4 fact saying that when money is made more avail-
5 able, the price of housing is going up?

6 MR. MacDONALD: What I am saying, I
7 am drawing the analogy, I would like to draw the
8 analogy, Mr. Brown, of the used car market. If
9 the facilities were not available as they are
10 and have been for some time, for a professional
11 automobile dealer, the man in the profession,
12 to take in a used car, refurbish it and resell
13 it to the public, I think human nature is such
14 that we would see a great deal more wrecks
15 travelling the road today.

16 I apply this to the housing field,
17 that if N.H.A. loans were available on used
18 homes, first of all you would avoid all this urban
19 sprawl which we have today, because people have
20 to go to the exterior and the periphery of the
21 community to buy houses with low down payments;
22 secondly the builder would be able to take these
23 houses on trade, refurbish them and at that
24 stage when they are about up to C.M.H.C. standards,
25 he gets an N.H.A. loan. I think this would do much
26 to remedy the deterioration that is taking place
27 in our cities.

28 The question that is thrown back at
29 you in that connection sometimes is that there
30 is a shortage of mortgage money and where is this

1 money going to come from for these loans? I
2 think the answer to that to some extent is that
3 if the subsidies which the government at various
4 levels are putting into this thing, which I say
5 averages 50 to 80 per cent of the value of the
6 land, if this money were left with the taxpayer
7 by the normal cycle it would be invested back
8 by the public in the form of mortgages.

9 COMMISSIONER GIBSON: And the reason
10 this does not happen on conventional mortgages
11 is the 66 and two-thirds per cent restriction?

12 MR. MacDONALD: Yes, that is a big
13 factor and I think, Mr. Gibson, that to get this
14 thing rolling in these areas, because of this
15 situation existing now, and these areas have
16 deteriorated to some extent, that it is going
17 to take N.H.A. backing to get the companies,
18 private lending institutions started making
19 reasonable loans in there, and I think once they
20 get started and see these areas develop they will
21 be into conventional loans too.

22 THE CHAIRMAN: Further questions?
23 Thank you very much, gentlemen.

24 -----

SUBMISSION OF THE SECURITY
ANALYSTS' ASSOCIATION OF
TORONTO

APPEARANCES:

Paul S. Deacon	- President
Leonard E. Barlow	- Vice-President
Philip W. Speller	- Secretary
J. B. Purdy	- Treasurer
D. Stanley	- Past President
C. W. Goldring	- Director.

MR. DEACON: The Security Analysts' Association of Toronto is one of 28 member societies of the Financial Analysts Federation. Two of these are in Canada and the rest in the United States. Among the Federation's main functions is one described in the constitution as follows: "To work toward improvement in the quality and quantity of financial information disseminated by corporations; to make and publish surveys and studies with recommendations for improvement of corporate financial reporting."

Analysts are interested in promoting better information for several reasons. Two of the most important are:

Adequate information is essential to assess companies and industries and hence their securities. If investors are forced to appraise values on the basis of inadequate information, they

1 are more likely to make bad decisions and to lose
2 confidence in investing.

3 Good information, widely disseminated,
4 promotes broader interest in a security. As more
5 investors become interested in a stock or bond,
6 it becomes much easier to buy or sell that
7 security, and both buyer and seller can have more
8 confidence that the price is fair. Development
9 of broader and more dependable markets for
10 securities makes it easier to finance projects in
11 Canada and to promote still wider ownership of
12 existing companies.

13 Our Association considers the existence
14 of adequate corporate information to be of con-
15 cern to this Commission because broader ownership
16 of securities by Canadian individuals and insti-
17 tuitions is vital to the development of Canada's
18 business and industrial life on a sound basis.

19 The provisions of the federal and pro-
20 vincial companies Acts which set the minimum
21 standards for much of the information now available
22 on Canadian companies, were written, in the main,
23 to protect minority owners from the abuses that
24 might result from the actions of the controlling
25 shareholders.

26 Our purpose is much broader. We do not
27 quarrel with the right of the majority to rule.
28 We suggest, however, that management and the con-
29 trolling shareholders consider minority share-
30 holders as partners and provide them with informa-

tion that will allow them to be intelligently informed about their company's affairs. Because this information is made public to shareholders, it should also be made available to all investors so that a more accurate appraisal of the company's securities can be made.

We commend the Investment Dealers' Association of Canada and the stock exchanges for their endeavours to secure better standards of information.

Many companies, through enlightened self-interest, are voluntarily going far beyond the legal minimums, by providing better and more frequent information on their affairs. However, we believe that some compulsion may be needed to bring other companies up to adequate standards.

We propose to discuss the present state of information on publicly-owned companies under the following headings:

1. Annual Reports.
2. Interim reports.
3. Proxy information.
4. Prospectus information.
5. Jurisdictional problems.

In this brief, we cannot go into detail on all the aspects of the problem. However, here are some of the recommendations to which we wish to draw special attention.

I would just like to make one other mention about our group. We are made up really

1 of people working on securities on both buying
2 and selling side, from banks, institutions
3 such as insurance companies and investment houses,
4 that type. There is a fairly wide group of in-
5 dividuals working on security analysis in our
6 group.

7 COMMISSIONER LEMAN: Mr. Deacon,
8 of the things you would like to see bring about
9 this better standard of reporting how much do you
10 think has the Stock Exchange put into force
11 themselves alone for listed shares?

1
2
3 MR. DEACON: I can only go by the
4 experience in the United States, perhaps, where
5 the top exchange back in 1926 -- I think at that
6 time they had something like 35 or 40 per cent
7 providing an interim report. They sent out a
8 letter requesting that the companies try to provide
9 this. They started to put some teeth in it by the
10 early 30's when all the investigations into the
11 market were going on. They finally got to the
12 stage by saying that new listings by a company --
13 a condition would be that they provide interim
14 reports. So that now, I think, 96 per cent provide
15 information. There are only 1 per cent, or less
16 than 1 per cent who don't provide it, and some
17 provide it quarterly and some on a semi-annual
18 basis. So, in this instance at least the stock
19 exchange has been able to bring this in in an
20 effective way. It has not extended too far beyond
21 that, but the top New York exchange has achieved
22 this.

23 COMMISSIONER LEMAN: But if a stock
24 exchange wanted to do it, they could do it, couldn't
25 they?

26 MR. DEACON: Yes, I believe they should
27 be able to do it on the basis -- they have started
28 a procedure here, but so far have not made much
29 progress.

30 COMMISSIONER LEMAN: Do the stock exchanges
basically agree with all that you feel is the required
minimum for good standards?

MR. DEACON: I don't know; I can't
answer for them. I think they generally agree that

1
2
3 interim information is desirable. So far they
4 haven't apparently felt that they can push it any
5 further than that.

6 COMMISSIONER LEMAN: In paragraph 6 at
7 the beginning of the summary you say:

8 "We commend the Investment
9 Dealers' Association of Canada and the
10 stock exchanges for their endeavours
11 to secure better standards of information."

12 You commended them, but would you commend
13 them even more if they got together and said, "We
14 are going to have these standards and that is all"?

15 MR. DEACON: Yes, I think we would.
16 I think they have got -- they have started and done
17 something that helped improve it, but so far I
18 think we would feel they haven't gone far enough.

19 COMMISSIONER LEMAN: I am really leading
20 up to my questions; these are interim questions:
21 Would you plump right down for an S.E.C. in Canada?

22 MR. DEACON: No, I think not. In fact,
23 I think our brief explains this a bit. We think we
24 would like to avoid a bureaucracy where everybody
25 has to file every piece of information with these
26 people and have it looked over. The experience
27 in Washington, the S.E.C. has done some wonderful
28 things for the information available from companies,
29 but it also has meant a proliferation in the number
30 of civil servants and the cost of doing business.
Anyone who has to do an underwriting through the
S.E.C., compared to the cost up here it is very great.
What we have tried to suggest -- we don't know the
answer, but we have tried to suggest if some way

1
2
3 could be found for requiring that this information
4 be provided and then a penalty if you don't do it,
5 and a way in which a shareholder who felt he had
6 not been given sufficient information could appeal
7 and get that information fairly cheaply. I think
8 some of our laws now would give them a fair amount
9 of protection, but it is so costly to get involved
10 that the companies can ignore it.

11 COMMISSIONER LEMAN: Perhaps I am not
12 being very subtle, but it seems to me you just admitted
13 that the groups who should enforce this without
14 intervention by the legislature don't do it, and
15 yet you say let us not ask the legislature to do it
16 either. So, who is going to do it?

17 MR. DEACON: I think I should put it
18 this way: We think there are two groups who are
19 in a position to do it without legislation: One
20 is the stock exchanges and the second the I.D.A.,
21 and if they feel they are not in a position to do it --
22 and up to now they haven't done it -- then the third
23 one is some stronger compulsion in the law. When
24 I say we don't want an S.E.C., I am saying we think
25 you can have stronger legal minimums and still
26 not get to the large organization necessary to police
27 things that would go with an S.E.C.

28 THE CHAIRMAN: Isn't that the whole
29 difficulty with laws? If you cannot enforce them
30 what good are they? Laws of this kind require
some special means of enforcement otherwise people
don't obey them and nobody takes any interest in
seeing that they do -- or, they do it at some expense
to themselves, as you say. I am not suggesting I have

1
2
3 any strong views about an S.E.C. in Canada. I see
4 many reasons against it, but this security business
5 is a very difficult business to handle, as you know.

6 MR. DEACON: I think we would expect
7 to do the jobs we are asking to be done that there
8 would be some increase in personnel or in the quality
9 of personnel so as to ensure the administration is
10 well handled, because I don't think they can physically
11 cope with some of the things we want done. On the
12 other hand, we think by providing a board or a court
13 to which you can go -- we suggest something like
14 the Tax Appeal Board -- and I have forgotten what
15 the costs are: About \$100 or something-- maybe
16 \$25, where you can go and have your day in court
17 without going through all the business of hiring
18 lawyers, and so on. This is one reason we put that
19 in the brief. In other words, we feel that most
20 shareholders ---

21 THE CHAIRMAN: They don't want to hire
22 lawyers -- that is it?

23 COMMISSIONER BROWN: Perhaps we should
24 ask the opinion on the stock exchanges. In the opinion
25 of your association do you think if the stock exchanges
26 said that any companies that did not supply this
27 information by the end of 1963 were going to be
28 delisted -- do you think they are in a strong enough
29 position to do this?

30 MR. DEACON: I think that they are getting
to the stage, yes.

COMMISSIONER BROWN: Do you think they
are now?

MR. DEACON: Yes, I think so.

1
2
3 COMMISSIONER LEMAN: Would you say
4 definitely they would be strong enough if the
5 I.D.A. was fully behind them too?

6 MR. DEACON: Yes. I will tell you what
7 I have run across before, and if you have competition
8 between the Toronto and Montreal exchanges, if you
9 got Toronto, Montreal, Vancouver agreeing they
10 were not going to accept listings from companies
11 who didn't live up to these standards, if they all
12 got together and said; "We will tick them off the
13 board", I think it could be done. But at the moment
14 they so far don't seem to have reached this kind of
15 approach, and among the dealers it is a difficult
16 thing. They will say, "Another house will take this
17 if you insist on providing quarterly reports. We
18 don't want to make them and we will go to a house
19 that will underwrite our issue that doesn't insist
20 on that". I don't know of such really concerted
21 action---

22 THE CHAIRMAN: Doesn't it really get
23 down to that, that if the stock exchanges and the
24 I.D.A. were serious with it themselves and prepared
25 to handle it themselves and discipline their own
26 members and make sure their own members did supply
27 the quality and quantity of information laid down,
28 then you would not have to have any outside policing
29 at all. But the difficulty arises with an organization
30 of that kind in putting them into the position where
they have to police their own members. It is a very
difficult position for them to be in, but the same
thing applies to all professions -- the medical
profession and the legal profession. There is no

1
2
3 reason why it should not be done by the stock
4 brokers. As a matter of fact, my recollection is
5 that the stock exchange does pretty well police
6 itself.

7 MR. DEACON: They do a lot through their
8 filing statements on the mining securities. They
9 have greatly tightened up there.

10 THE CHAIRMAN: But perhaps this particular
11 problem has not been taken hold of to the extent
12 you think it should be.

13 MR. DEACON: That is right.

14 MR. STANLEY: I just wonder if some of
15 these functions fall logically under the function of
16 a stock broker. Take, for instance, proxy statements:
17 One of the statements in our brief is that share-
18 holders before voting their stock at meetings or
19 being asked to vote it should be given certain
20 information regarding the action proposed to be taken
21 at the meeting regarding the qualifications of those
22 proposed as directors. Why should the responsibility
23 of enforcing the supply of this information be laid
24 at the door of the person engaged in trading? Surely
25 this is a matter of the rights of the shareholders
26 vis-a-vis the company. They are laid down in the
27 Companies Act by the legislature, and isn't it logical
28 to look to the legislature to clarify this rather
29 than looking to a group of people who are merely
30 buying and selling the outstanding securities to
enforce them?

THE CHAIRMAN: If they won't enforce
it themselves, they will have to submit to the
legislature. If it is outside that information that

1
2
3 should be made available, there may be some question
4 about that.

5 COMMISSIONER GIBSON: On this matter
6 of simply reporting on the state of the company --
7 balance sheets and profit and loss statements --
8 perhaps you could distinguish that from certain of
9 your other recommendations which have to do perhaps
10 more directly with the obviously questions between
11 the shareholder and the company. But on this
12 question of reporting, why is it such a difficult
13 problem? Why is there this reluctance to make
14 information of this kind available? Could you say
15 a little more about this? There are various factors:
16 Competition is one. Sometimes companies are very
17 reluctant about the thought of disclosing a bad year,
18 for example, or sharp decline, or something of this
19 kind?

20 MR. DEACON: I think that is very true.
21 I have seen cases where companies have started to
22 make interim reports and suddenly run into a bad
23 period and do not like to advertise it. My own
24 view is that if they built up a reputation for
25 reporting regularly, good or bad, they would develop
26 a much better reputation in the investment business
27 than one that just wants to tell the good news.
28 Competition is certainly one of the things you hear
29 about, and in this country it is a special problem
30 because so many of the competitors are owned outside
the country and do not have to report. They say,
"Why should I disclose my sales and interim results,
and so on, when all my competitors have no compulsion
at all?", and that is sort of a special in Canada.

1
2
3 Against that, I think the record shows the companies
4 that do report regularly have not suffered as a
5 result. They have certainly raised their stature
6 in the eyes of the investment community. I can
7 remember having a call made to me to find out about
8 a particular company: Did I know whether they were
9 considering bringing out interim reports? They knew
10 the background, and that it was a good company, but
11 they said, "We can buy lots of others where we know
12 we can get interim information, and unless they are
13 going to keep us informed we don't want any part
14 of it." I think the ordinary investor, -- I think
15 most would agree that this is essential -- if you
16 have the feeling that when you want to get information
17 about a company that you have got it, and that you
18 are going to be kept informed regularly.

17 COMMISSIONER GIBSON: Did you see actual
18 evidence that companies which had a good record of
19 financial disclosure do better in selling their
20 obligations, and their obligations sell at a better
21 price than companies that do not?

22 MR. DEACON: I can think of this one
23 particular one which sells at a lower price relative
24 to its competitors because it has got the reputation
25 for not saying what it is doing, and I think also
26 you will find the ones that are disclosing it are
27 generally the leaders. I don't know which comes
28 first, but it seems more than an accident that they
29 happen to be the ones doing well in business.

29 COMMISSIONER GIBSON: But you have given
30 a lot of thought to this question of what is reasonable
in terms of competition and these various factors?

1
2
3 MR. DEACON: I have talked to people
4 about, for instance, the sales figure, and I have
5 found if I want to find out the approximate volume
6 a company is doing that the best way is to go to
7 his competitor because he is usually pretty close,
8 and I have talked to accountants about it and they
9 seem to agree, as far as they can see, the disclosure
10 of this information would not damage the company's
11 interests.

12 COMMISSIONER GIBSON: You are not talking
13 about breakdowns of sales figures? This gets you
14 into an area where the competition argument becomes
15 perhaps a little sharper.

16 MR. DEACON: Not detailed ones,
17 but I think in a company that is doing various things,
18 a general breakdown of say a pulp business -- say,
19 how much from market pulp and how much from paper,
20 or something like that, are not damaging and still
21 extremely helpful to the analyst, and he knows
22 what is going on in the paper market and in the pulp
23 market and can make some assessments. The same with
24 the banks.

25 COMMISSIONER MacKEEN: Wouldn't you agree
26 that while a great many companies could disclose
27 information as to their sales, there are certain
28 other classes that might give their competitors
29 information which would be harmful to that company?
30 In other words, they should not do it? I have
reference particularly to a manufacturer in a specialty
line who brings out a new line which may or may not
increase the sales materially: It would be important
to his competitor to know the effect of that line.

1
2
3 Again, it might be that he starts an advertising
4 campaign that possibly would increase sales a great
5 deal or only a moderate amount, and he wouldn't
6 want his competitor to know that.

7 MR. DEACON: Yes, I don't think we would
8 demand you get down into too much detail.

9 COMMISSIONER MacKEEN: What I mean is,
10 just the gross sales which would reflect any new
11 move?

12 MR. DEACON: I cannot believe, knowing
13 the 1960 figures and the 1961 figures, and knowing
14 he started that new line in that period, that they
15 could automatically calculate this is what is
16 accounting for his volume, and again from experience
17 and talking to people, most competitors who are doing
18 any good intelligence work at all get a pretty fair
19 idea of what volume he is doing by checking the record
20 in other ways. First of all, the other items may
21 have been the ones that put his sales up, or it may
22 have been much greater because the others went down.
23 I don't think you would giving away too much, except
24 in a single product company, and even that would
25 be unsure.

26 COMMISSIONER MacKEEN: On interim reports,
27 say, quarterly, there are some manufacturing industries
28 that do a seasonal business: In other words, they
29 may run for two-thirds of the year and just scrape
30 along the last period, and that might make up their
profit for the year, but might not the interim report
convey wrong information to the shareholders, or
prospective shareholders, if they just took the first
three-quarters when they would see the company running

1
2
3 at a loss, whereas for the whole year they actually
4 turned out a profit?

5 MR. DEACON: Again, I think our idea
6 here is that you would always put these out with
7 comparative figures to go with them, and this
8 eliminates most of the problems of seasonal business.
9 The gas business is a good one where you might get
10 a quiet summer. Union Gas is a good one where they
11 do provide them, and there is almost always a loss
12 in the first half, but you have comparative years
13 to put up against it. One of the companies puts
14 up a five-year comparison, so that the seasonal
15 effect does not become a problem.
16
17
18
19
20
21
22
23
24
25
26
27
28
29
30

1
2
3 COMMISSIONER MacKEEN: I think it would
4 be all right in a utility business but I cannot
5 think of manufacturing businesses where the disparity
6 would be greater?

7 MR. DEACON: Well, retailers would have
8 that problem, for instance, but again I do not think
9 as long as you have got comparable figures it would
10 matter if you showed a loss in the first half. Nobody
11 is misled by that as long as those four or five
12 figures are side by side.

13 MR. PURDY: In addition it is always
14 possible to produce year-to-year figures if a company
15 is in a seasonal business so that in the 12 months
16 ending, the latest quarterly report can be compared
17 to the 12 months ending quarterly and if your
18 important quarter is the last quarter of the year
19 you can check with the preceding year's same quarter.

20 MR. DEACON: Some companies are doing
21 that now.

22 MR. SPELLER: I think it is also fair
23 to comment that the natural gas business is about
24 as seasonal a business as one could find. It is
25 quite usual for the majority of these companies,
26 depending on their franchise, doing all their reporting
27 in a calendar quarter. They frequently report a
28 12-month profit below what they show in the 12-months
29 quarterly schedule.

30 COMMISSIONER MacKEEN: They take the
previous 12 months' figures?

MR. SPELLER: That is correct and one
can, of course, check quarter by quarter comparison
if he desires.

1
2
3 COMMISSIONER BROWN: Mr. Deacon, Mr.

4 Leman asked you whether you were in favour of an
5 S.E.C. type of operation and regulation and I gathered
6 that you were not. In view of the fact that some
7 companies are under federal charter and a lot of
8 companies are under provincial charter and in view
9 of the fact this is a federal commission how do
10 you visualize that we can make recommendations in
11 line with what you envisage without involving some
12 form of S.E.C. type of operation?

13 MR. DEACON: Well, there is a companies
14 act now, first of all, a federal companies act, and
15 I would think if it were of a higher standard it
16 would help by example to raise standards elsewhere.
17 I think you have found that in Ontario. Ontario's
18 is now in many respects a better act than the federal
19 act and you have seen British Columbia and Saskatchewan
20 follow pretty much the same pattern.

21 I think you would then see some more
22 effective provisions coming through if we had a good
23 federal act. We would have a chance of having the
24 other provinces come into line.

25 We did not want to get into the
26 constitutional part of it. We realize there is a
27 problem of a central authority under the B.N.A.
28 We wondered if there might be some opportunity
29 through the fact that this might be considered
30 inter-provincial trade by which the federal government
could have something to say about what goes on in
the securities business.

There has been some movement towards
uniform working out over the years. It has been

1
2
3 pretty slow. Maybe the Commission could find a
4 way of recommending how it could be speeded up
5 but as you know, they were working on a uniform
6 companies act and have been working for some years.

7 COMMISSIONER IEMAN: Mr. Deacon, if I am
8 right in continental Europe there are a large number
9 of companies that do not report according to your
10 standards, and large ones too, and as I understand
11 it that makes North America rather reluctant to invest
12 because of that reason but within their own area
13 how do they contend with this lack? The public seems
14 to be reasonably satisfied, doesn't it?

15 MR. DEACON: I think what happens
16 characteristically there is that there are sort of
17 large bank associations with some of these companies
18 and the technique, as I understand it, is you get to
19 know the people in the bank and the banks keep close
20 touch and sort of know which books they are using.

21 MR. SPELLER: Also too, I think it is
22 fair to comment, that they do not have the broad
23 securities ownership in general there that we do.

24 MR. DEACON: It is coming. Germany has
25 greatly strengthened their requirements. They are
26 very aware of this on the Volkswagen issue, I think
27 they put out, to try and develop a broader ownership.
28 I think they are coming around to the North American
29 approach.

30 COMMISSIONER IEMAN: I would like to ask
you another question which is a little bit out of
your brief because you have covered the area of
reporting mainly but in discussing the advisability
of having an S.E.C. there is another aspect there

1
2
3 and that is equitable dealings in securities. From
4 that angle would you care to comment on the advisability
5 of having one or not in view of the facts of the
6 case in Canada?

7 MR. DEACON: We have not really gone
8 into this part of it, I suppose, but again I think
9 if you provide a proper information on which to base
10 decisions to buy or sell which is what the individual
11 has to make and through your securities commission
12 make as sure as possible that the people who are in
13 the business are competent and well qualified, then
14 I think that our suggestion about providing a sound
15 law and penalties and a third part, to make a
16 person not just have a penalty and go on doing it
17 but forfeit the stock I think that may achieve
18 something really. Our securities commissions here
19 are pretty active and you can see how as a bad
20 apple get thrown out of one they would try another
21 province and then they would get thrown out of that
22 and shifted on to another and as they total standards
23 are raised eventually we would hope to solve that
24 problem through a better act and better administration.

25 COMMISSIONER LEMAN: You see, you are
26 security analysts and through these reporting suggestions
27 you have made in the securities field you are addressing
28 yourself to the sophisticated securities investor
29 but what I am worried about is the unsophisticated
30 investor who practically has to be protected against
himself, doesn't he?

MR. DEACON: Yes.

COMMISSIONER LEMAN: You will find that
although securities analysts will go to great trouble

1
2
3 to analyze an investment and recommendations are
4 made to others I think you will find the average
5 shareholder who is not a professional in Canada does
6 not even read the annual report.

7 MR. DEACON: I am not too worried about
8 this because I think most investors do consult their
9 broker and if the broker is well qualified and has
10 access to information he can advise them and they
11 are more likely to listen to him. I think you have
12 got a better chance of keeping it straight if you
13 have got the information.

14 COMMISSIONER LEMAN: There are a couple
15 of "ifs" in your answer?

16 MR. DEACON: Well, when people seem to
17 think there is something magic about the long distance
18 telephone call telling them that if they buy a
19 certain stock they will double their money overnight
20 I do not know how you can get that fellow off the
21 list.

22 MR. SPELLER: If I may, I think that it
23 is true a sophisticated investor has generally for
24 many years in most communities had the information
25 he needed to make his investments. Certainly the
26 broader type disclosure that we are interested in
27 achieving is designed to help primarily if not
28 entirely this very small investor and certainly, as
29 Paul has pointed out, the availability of this
30 information does allow those of us who are in business
to be in the position of counselling small investors
as opposed to large ones.

COMMISSIONER GIBSON: Could you on this
subject give us some idea of what proportion of the

1
2
3 brokerage firms you have as active members of
4 your society?

5 MR. DEACON: We have 268 members.

6 MR. GOLDRING: I would say by far the
7 vast majority of brokerage houses would have members
8 of their firms members of securities analysts. It
9 would be well over 90 per cent if you want a percentage
figure.

10 COMMISSIONER BROWN: But is it at the
11 department level?

12 MR. GOLDRING: It depends who attends
13 the meeting. Even if the membership is in the
14 partner's name it may be somebody in the analytical
department who attends.

15 COMMISSIONER BROWN: Does he carry
16 a vote on the stock exchange?

17 MR. GOLDRING: Our membership would
18 generally not, no.

19 MR. DEACON: I think there is a greater
20 attention paid to the analyst now because if they
21 want to sell institutions or anything else it is
22 competition of people with the ^{best} information possible
23 and the best analysis of the value of securities
24 and a good record goes a long way to get in the door
the next time.

25 COMMISSIONER GIBSON: This applies to
26 the sophisticated investor but not necessarily the
27 small investor.

28 MR. DEACON: I think the small investor
29 is the same thing. If he has done reasonably well
30 and a sound securities analysis has produced that
result he is willing to go back and invest again.

1
2
3 I find, for instance, on investment clubs -- we get
4 a lot of mail on these -- they get books on how
5 to analyze securities and they say: "Can you provide
6 the sales figures for such and such a company?"
7 Sometimes they say: "I cannot find them anywhere in
8 the United States?" And yet this is a basic analysis
9 which they are supposed to have. There are literally
10 thousands of these people around and I think it is
11 a marvellous potential market for the securities
12 business and yet they come up against a lack of
13 information and they perhaps make wrong decisions
14 or get fed up.

15 COMMISSIONER LEMAN: A little while ago
16 in a burst of generosity you admitted the S.E.C. has
17 done a lot of good in the United States. Now, can
18 you tell us what harm they have done?

19 MR. DEACON: Well, I think they greatly
20 increased the cost of doing an underwriting for one
21 thing. I don't know -- maybe some of my underwriters
22 here may give you the comparative figures but I know
23 the cost of putting something through S.E.C. is pretty
24 gigantic.

25 MR. BARLOW: I have not had too much
26 direct experience with American underwriters but
27 it is generally felt that the legal costs are three
28 or four, maybe five times what they would be here
29 just to prepare the necessary written documents,
30 and also there is a time factor involved in the processing
of the documents down there. Printing costs are very
expensive and very heavy so in the event we had an
S.E.C. type of programme here it would certainly
provide a burden of financing costs of Canadian companies

1
2
3 which at the present time they do not have to carry.

4 COMMISSIONER LEMAN: Is this inherent
5 in having any securities commission in the country or
6 is it the fact that in fact you feel that perhaps
7 they have gone too far?

8 MR. BARLOW: I think it is part of the
9 bureaucracy that has grown up around the S.E.C.
10 that has been partially responsible for these costs.

11 MR. GOLDRING: There are two reasons for
12 our opposition to the S.E.C. in its exact form in
13 the United States. One is cost and it affects the
14 smaller companies most severely, of course. The
15 second lies in the rules which might be -- at first
16 take certain full disclosures which are made by
17 devious measures to avoid those rules. They make
18 all kinds of amendments and it finally ends up by
19 the lawmakers in their wisdom giving final discretion
20 to judge a particular point. This introduces to us
21 a very ominous factor in the financial flow of funds,
22 namely, an official who has discretion to rule one
23 way or the other and he is really a third party. I
24 do not refer precisely to government control; I
25 refer to more or less bureaucratic control. Our
26 idea here is to obtain more facts and figures from
27 companies but without the octopus-like organization
28 which would necessarily review all financial
29 statistics which come from all companies under the
30 proposed improved laws.

31 COMMISSIONER BROWN: Do you suggest that
32 there are enough competing jurisdictions in quantity
33 to prevent Parkinson's law becoming effective?

34 THE CHAIRMAN: Well; you want these

1
2
3 provincial authorities to deal with this particular
4 problem.

5 MR. GOLDRING: We do not envisage any
6 authority pursuing a full review of all financial
7 statements.

8 COMMISSIONER BROWN: We are talking about
9 the information you are asking for here.

10 MR. GOLDRING: We are suggesting that
11 in the laws of the province and the federal government
12 that there is a cheap, easy recourse and penalty
13 to those committing offences in order that there
14 would not be this bureaucracy. This is an alternative
15 route which may achieve the desired end.

16 COMMISSIONER BROWN: You still would have
17 to have some enforcement agency.

18 MR. GOLDRING: Right, and this would
19 be the court or a board similar to the Tax Appeal
20 Board which would be activated only upon the registration
21 of complaint by a shareholder or a member of the public.

22 THE CHAIRMAN: Well, why not just use
23 the Securities Commission that we have?

24 MR. GOLDRING: It seems to us that they
25 would be good for 95 per cent of the material.

26 THE CHAIRMAN: You want a new board set
27 up similar to the Tax Appeal Board. Why not use
28 the board we have which has some familiarity with
29 the securities business or you might prefer some
30 over-all federal board in substitution for all the
provincial?

MR. GOLDRING: This would certainly be
desirable from the point of view of efficiency but
whether it is possible constitutionally I do not know.

1
2
3 THE CHAIRMAN: I do not know whether
4 I would go that far with you but if anything is to
5 be done about this, if it is desirable to have any
6 step taken that will be effective, it seems to me
7 there has to be some sanction and it is either a
8 voluntary system within the membership of the
9 stock exchanges or the Investment Dealers' Association
10 or the only alternative is some legislative sanction.

11 MR. DEACON: I think you cannot count
12 too much on the I.D.A. in one sense where they do
13 not have to come up especially to the I.D.A.
14 A company might not go to the market for years so
15 there is no opportunity to force that company to do
16 anything. They could fall back on what is in the
17 law and in the second place on the exchanges all of
18 the companies are not listed so again you come back
19 on the law as the final authority. I think there
20 is something to be said for having a central pattern
21 or certainly uniformity of legislation. I think
22 uniformity is something we would prefer to see.
23
24
25
26
27
28
29
30

1 COMMISSIONER LEMAN: Our Income Tax
2 Act has complicated enactments and, the same as
3 you described a minute ago where the Stock Ex-
4 change makes simple rules, people try to get
5 around that and they make new rules to block
6 the holes, etcetera. What I am wondering is,
7 do you perhaps visualize the possibility that a
8 securities exchange commission could work well
9 and smoothly and not fall into bureaucratic
10 tendencies by watching whom you appoint to such
11 a committee.

12 MR. GOLDRING: Would you envisage this
13 commission reviewing all the material which is
14 put out by every company? In other words, if
15 a company, small, junior industrial, wishes to
16 raise financing, would it have to file with this
17 board the full documents as required by the U.S.
18 Securities Commission?

19 This is, I think, essentially the
20 difference in our approach, that they would, in
21 our feeling, have to file with a recording
22 secretary all this material and make it public,
23 and they would be obliged by law to make full,
24 complete and plain disclosure of this material;
25 but there would not necessarily be a number of
26 obviously highly paid and necessarily well-
27 trained people to peruse all this material in
28 order to make sure that what it purports to say
29 is so. This is what the S.E.C. does and it has,
30 as you know, a gigantic staff in order to accomplish

1 it.

2 THE CHAIRMAN: As I understand it, the
3 S.E.C. now receives all this information and
4 they look over it and check every statement that
5 is made and decide then and there whether it is
6 right or not.

7 MR. GOLDRING: Yes, that is substan-
8 tially correct.

9 MR. BARLOW: Not only the statements
10 that are made but the statements that may not be
11 made.

12 MR. GOLDRING: Exactly.

13 MR. BARLOW: There is a deficiency re-
14 gulation requesting additional information.

15 MR. STANLEY: I think they decide then
16 and there. That is one of the difficulties.

17 THE CHAIRMAN: Also the difficulty is,
18 no matter how fine an organization is set up on
19 paper, everything depends on the men who administer
20 it. You may have a very satisfactory and liberal
21 administration for awhile, but then a little later
22 it may change, be tough and probably unreasonably
23 so - using "liberal" with a small "l".

24 COMMISSIONER GIBSON: In fact you are
25 saying that you would like to have full disclosure
26 as defined in your brief, made obligatory under
27 the law, but that you would not have any sub-
28 stantial enforcement organization or checking
29 organization. Is that a fair statement of what
30 you are saying? - To rely on security analysts

1 and the public and so on.

2 MR. GOLDRING: To give evidence.

3 COMMISSIONER GIBSON: Check up and so on.

4 MR. GOLDRING: Of untrue statements,
5 and an easy direct access, so that a person who
6 discovers a falsehood or error, breaches of
7 law, can inform the government and the government
8 can then take action if it deems this is sufficient
9 as far as a breach is concerned; or conversely,
10 if the government does not choose to do so,
11 the shareholder~~x~~then or the member of the public,
12 can then have access to a reasonably efficient -
13 just thinking out loud - rather flexible type of
14 board made up of members connected with the
15 financial business in some way or other -
16 accountants, members of the stock exchange or
17 some such people as that.

18 COMMISSIONER GIBSON: Would there be
19 much "teeth" in this?

20 MR. GOLDRING: It is effective in the
21 Combines legislation.

22 MR. SPELLER: This disclosure of the
23 type we have outlined here, would be an integral
24 requirement in the Federal Companies Act, and we
25 would hope that there would be "teeth" - the
26 same teeth that do exist in any clause in the
27 Companies Act now.

28 THE CHAIRMAN: Is that not the system
29 under which the Securities Commission work here,
30 for all disclosure?

1 MR. SPELLER: Yes, sir. I think we
2 would like to amplify - in short we would like to
3 use existing machinery.

4 THE CHAIRMAN: To indicate what must
5 be disclosed in greater detail.

6 MR. DEACON: We want more detail.

7 MR. SPELLER: Correct, and we hope
8 therefore to have the main, if not all the ad-
9 vantages and a minimum of the disadvantages of
10 over-centralization.

11 COMMISSIONER GIBSON: Do you see much
12 evidence that your own efforts have brought
13 forth results? You have been meeting for some
14 decade, haven't you, and have grown quite a lot.
15 You have been asking people to tell you about
16 their companies. Have you noticed a spread of
17 the results you are trying to have?

18 MR. DEACON: I would think so from my
19 personal experience. I can remember one chap
20 that went on the board of a company for the first
21 time, and at the first meeting he happened to
22 mention about public quarterly reports, and the
23 management said: "Would you like to have quarterly
24 reports? Sure, we will provide them." Somehow it
25 had not occurred to them.

26 I would think also that the chartered
27 accountants - and we ran in the "Post" this
28 contest for the best report and it has really
29 remarkably improved in the attention that is paid
30 to it. This is all on a voluntary basis, and I

1 think a lot of companies should be commended for
2 what they have done. They have gone far beyond
3 what is required by law. However, there are
4 still a great number who have not, but there is a
5 gradual improvement, I think all of us would
6 agree.

7 MR. SPELLER: I think there is no
8 question the standard of reports over the past
9 decade has improved very significantly, and it is
10 noticeable in specific industries. Some industries
11 have not kept pace, but there is no question about
12 it. Who can take credit for this is problematical.
13 We hope we have been helpful.

14 THE CHAIRMAN: Thank you very much,
15 gentlemen.

16 --- Adjournment.

"Merchant Bank"

Summary

-----oOo-----

This brief concerns the N.H.A. mortgage market and its aim is to broaden the market in N.H.A. mortgages, and find new sources of private funds of all sizes to finance home ownership in Canada, to assist the Government in freeing the funds that are tied up in their direct lending programme with Central Mortgage & Housing Corporation, to create a secondary market, which would enable present N.H.A. mortgage lenders to diversify their portfolio, and to interest other large investors, such as Pension Funds to buy N.H.A. mortgages and give them a measure of liquidity.

Proposal

1. Continue the offerings of N.H.A. mortgages originated by C.M.H.C. and bring C.M.H.C. into the mortgage market in the same way the Bank of Canada acts in the Government market.
2. Establish banking arrangements to facilitate dealers, who hold positions in N.H.A. mortgages and streamline administration transfers.
3. To issue funds (F.N.M.A. type) to attract the small to medium investors, having from \$1,000 to \$50,000.

The Present Mortgage Picture

The N.H.A. Act was set up to encourage home ownership and to enable large lenders to grant loans and to administer the mortgages. This was accomplished by the Government guaranteeing to make good any losses on foreclosures.

Lenders

The lenders at the present time are the Government, through C.M.H.C., the chartered banks, the large insurance companies, trust companies and pension funds through the auspices of a trust company acting as their agent and administrator. The total number of approved lenders is 76. In 1961, the Government desired to increase

This brief concerns the N.H.A. mortgage market and its aim is to broaden the market in N.H.A. mortgages, and find new sources of private funds of all sizes to finance home ownership in Canada, to assist the Government in placing the funds that are tied up in their direct lending programs with Central Mortgage & Housing Corporation, to create a secondary market, which would enable private N.H.A. mortgage lenders to diversify their portfolio, and to interest other large investors, such as Pension funds to buy N.H.A. mortgages and give them a measure of liquidity.

Proposal

1. Continue the offerings of N.H.A. mortgages originated by C.M.H.C. and bring C.M.H.C. into the mortgage market in the same way the Bank of Canada acts in the Government market.
2. Establish banking arrangements to facilitate dealers, who hold positions in N.H.A. mortgages and streamline administration transfers.
3. To issue funds (F.M.A. type) to attract the small to medium investors, having from \$1,000 to \$50,000.

The Present Mortgage Picture

The N.H.A. Act was set up to encourage home ownership and to enable large lenders to grant loans and to administer the mortgages. This was accomplished by the Government guaranteeing to make good any losses on foreclosures.

Lenders

The lenders at the present time are the Government, through C.M.H.C., the chartered banks, the large insurance companies, trust companies and pension funds through the auspices of a trust company acting as their agent and administrator. The total number of approved lenders is 76. In 1961, the Government desired to increase

the number of buyers and offered blocks of mortgages owned by C.M.H.C. to approved lenders and investment dealers on competitive tender. Three series of offerings, totalling more than \$45 million, have been sold. Of the investment dealers, only Gairdner & Company and Greenshields Inc. have taken an active part. Some Trust Companies and banks have also tendered. Nearly all of the \$45 million of mortgages sold have been sold to buyers that already had purchased N.H.A. mortgages and were approved lenders. Less than five brand new mortgage buyers have been found to date, but some new interested potential buyers are coming along.

The approved lenders have sold more than \$320 million of N.H.A. mortgages to others. More than \$160 million has been sold to pension funds. Most of these pension funds are administered by the trust companies, and are the approved lenders that are selling. A large part of the remainder has been sold to foreign insurance companies and other small domestic insurance companies, who are not approved lenders. The seller (an insurance company or trust company) continues to act as administrator. In most all of these cases, then, the field of buyers, whilst spreading, is still kept in a very narrow family relationship.

Problems found in C.M.H.C. Tender and Mortgage Marketing.

The present C.M.H.C. tender has failed to interest new buyers, or broaden the market appreciably. It has, then, not accomplished what it was set out to do. This has been caused by the poor marketability of the N.H.A. mortgages compared to bonds. The poor marketability is partly caused by the inability of any jobber to buy the mortgages and finance them in a comparable way to the way he can finance bonds and stocks on call loans. At the present time, the Bank Act does not clearly allow the chartered banks to finance N.H.A. mortgages.

the number of buyers and offered blocks of mortgages owned by C.M.H.C. to approved lenders and investment dealers on competitive tender. These series of offerings, totalling more than \$45 million, have been sold. On the investment side, only Goldman & Company and Greenwich Ltd. have taken any share. Some Trust Companies and banks have also taken. Nearly all of the \$45 million of mortgages sold have been sold to buyers that already had purchased N.H.A. mortgages and were approved lenders. Less than five brand new mortgage buyers have been found to date, but some new interested potential buyers are coming along.

The approved lenders have sold more than \$300 million of N.H.A. mortgages to others. More than \$160 million has been sold to pension funds. Most of these pension funds are administered by the trust companies, and are the approved lenders that are selling. A large part of the remainder has been sold to foreign insurance companies and other small domestic insurance companies who are not approved lenders. The seller (an insurance company or trust company) continues to act as administrator. In most of these cases, then, the field of buyers, whilst spreading, is still kept in a very narrow family relationship.

Problems found in C.M.H.C. Tender and Mortgage Marketing.

The present C.M.H.C. tender has failed to interest new buyers or broaden the market appreciably. It has, then, not accomplished what it was set out to do. This has been caused by the poor marketability of the N.H.A. mortgages compared to bonds. The poor marketability is partly caused by the inability of any jobber to buy the mortgages and finance them on a comparable way to the way he can finance bonds and stocks on call loans. At the present time, the Bank Act does not clearly allow the chartered banks to finance N.H.A. mortgages.

1
2
3
4
5 They have chosen not to finance them for the dealers.

6 Another problem is that there is really more than one type of N.H.A.
7 mortgage. Those mortgages on houses that are in large Metropolitan areas, or in, or
8 near large Cities, can be administered by trust companies and insurance companies from
9 their local branches. These mortgages are of interest to approved lenders and admin-
10 istrators, who have a national branch system. In effect, these mortgages can be
11 administered cheaply and, therefore, command a higher price. Unfortunately,
12 there remains a large number of mortgages on houses in smaller Cities and Towns
13 across the country. Few lenders have the facilities to administer these mortgages
14 and, hence, they are of no value to them. They, therefore, command a lower
15 price, or are of just no interest to lenders at any price. (They would sooner buy
16 where they can administer, rather than have others administer). Since the trust
17 companies are the country's largest administrator of pension funds, they influence
18 the pension funds to only buy mortgages in places where they, themselves, can
19 administer. All of this tends to break the national market into small regional mar-
20 kets and gives a great advantage to the Metropolitan areas. In buying a mortgage,
21 then, administration ranks as high as investment quality and price, and tends to off-
22 set and make more difficult the establishment of a secondary market.

23 There still remains in the country restriction on investment that
24 prohibits some pension funds from buying N.H.A. mortgages. An example of this
25 are Provincial and Municipal employees' pension funds, which in every Province of
26 Canada, except Saskatchewan, are restricted from buying mortgages at present.
27 This eliminates a large potential source of funds from the market.

28 The Jobbers

29 With the restriction of the Bank Act, in not allowing mortgages to be
30

carried on call loan, the jobber is unwilling, and in many cases unable, to finance mortgages and, therefore, can only act as an agent. This means that a potential seller of a block of mortgages must either find a buyer himself, or tell a dealer that he will sell, and the dealer will try and find a buyer. The seller has no assurance at present when he can sell or at what price. If dealers could finance their mortgage inventory, this part of the problem would be solved, and the dealer could fill the middleman function.

Administration of the mortgages presents another problem. Most approved lenders would be willing to sell their mortgages if they could keep the administration in their hands as the fee charged for the administration makes administration profitable. Along with this, the way in which the mortgages are administered varies from one to the other. The way the records are kept also varies. This makes the transfer of administration difficult.

A Course of Action

1. For a secondary market.

Change the Bank Act to make it possible for the chartered banks to finance N.H.A. mortgages in the same manner as bonds.

Effect title transfer through the Bank of Canada in the same way that Government of Canada bonds can be transferred, i.e. if an owner of a Government bond resides in Vancouver and he decides to sell, and then going through a dealer, a buyer of these bonds is found in Halifax, the Bank of Canada agency in Vancouver will accept the bonds and issue the same issue in Halifax, registered in the new owner's name the same day. This makes for fast, efficient movement of securities in a national market. The Bank of Canada, as the Govern-

carried on call loan, the jobber is unwilling, and in many cases unable, to find mortgages and, therefore, can only act as an agent. This means that a potential borrower is forced to accept a price which is determined by the market at the time when he can sell or at what price the market is willing to pay for the mortgage.

Administration of the mortgage presents another problem. Most approved lenders would be willing to sell their mortgages if they could keep the administration in their hands as the fee charged for the administration makes administration profitable. Along with this, the way in which the mortgages are administered varies from one to the other. The way the records are kept also varies. This makes the transfer of administration difficult.

A Course of Action

For a secondary market

Change the Bank Act to make it possible for the chartered banks to finance M.H.A. mortgages in the same manner as bonds. Effect this transfer through the Bank of Canada in the same way that Government of Canada bonds can be transferred, i.e. if an owner of a Government bond resides in Vancouver and he decides to sell, and then going through a dealer, a buyer of these bonds is found in Halifax, the Bank of Canada agency in Vancouver will transfer the bonds and issue the same issue in Halifax, registered in the new owner's name the same day. This makes for fast, efficient movement of securities in a national market. The Bank of Canada, as the Government

ment's agent for C.M.H.C., could also effect transfer for mortgages in a similar manner with few added complications.

As regards administration, C.M.H.C., which is set up to administer mortgages on a national basis, should be allowed to administer any mortgages regardless of which approved lender originated them. They should be willing to do this at a set fee. This would overcome the problems that arise when a buyer of mortgages tries to get reluctant administrators to administer. Administration would not, then, rank as a factor as large as the price of the mortgages and would help to create a national market in the mortgages.

At the present time, if an N.H.A. mortgage goes into default, and is foreclosed, the Government Guarantee does not assure that the lender will receive his money back with interest to the date of payment. If foreclosure is lengthy, the lender suffers an interest loss. The result of this is that it is necessary to value the Government guaranteed mortgages, partly on the basis of where they are located and who is the mortgagee. This, then, established different prices for the mortgages even though they are all guaranteed. In effect, then, a penalty is charged if court action on foreclosure is lengthy. If this could be reversed to give a premium for speedy action, there would be an incentive to the administrator to act quickly, or if the Act was changed to eliminate the 2% reduction in interest after six months, and a larger allowance was made for legal expenses, foreclosure would not rank importantly in the investor's eyes.

C.M.H.C. should, besides making blocks of N.H.A. mortgages

C.M.H.C. should, besides making blocks of M.H.A. mortgage rank importantly in the investor's eyes.

former allowance was made for legal expenses, foreclosures would not to eliminate the 30% reduction in interest after six months, and a centive to the administrator to act quickly, or if the Act was changed reversed to give a premium for speedy action, there would be an incentive to the administrator to act quickly. If this could be is changed if court action on foreclosure is lengthy. If this could be pages even though they are all guaranteed. In effect, then, a penalty the mortgages. This, then, established different prices for the mortgages, partly on the basis of where they are located and who is of this it is necessary to value the Government guaranteed foreclosure is lengthy, the lender suffers an interest loss. The result will receive his money back with interest to the date of payment. If foreclosed, the Government Guarantee does not assure that the lender At the present time, if an M.H.A. mortgage goes into default, and is create a national market in the mortgages

as a factor in determining the price of the mortgages and would help to administrators to administer. Administration would not, then, rank the problem that arises when a buyer of mortgages fails to get reluctant They should be willing to do this on a set fee. This would overcome

later mortgages on a national basis, should be followed by similar As regards administration, C.M.H.C., which is set up to administer pages in a similar manner with few coded complications.

ment's agent for C.M.H.C., could also effect transfer for mort-

available for the market from time to time, enter the market with a bid and offer for blocks (same price Irregardless of location). In this field, they would act like the Bank of Canada in establishing a relatively smooth market. The reserve bid (slightly below the market) would tend to make all N.H.A. mortgages worth the same, i.e. the mortgages would trade on their residual Government guarantee and would establish a national price level, dependent on general interest rates. The offering by C.M.H.C. of blocks of mortgages, would also supply the market with its temporary requirements.

The ease of transfer, administration by C.M.H.C., banking facilities and C.M.H.C. market action, would, together, continue the broadening of the secondary market and would ensure the entry of other approved lenders as both buyers and sellers, and would make N.H.A. mortgages a liquid investment.

2. The Small Investor

The secondary market for N.H.A. mortgages, even when fully developed, will probably never be able to use the funds of the small investor (with from \$1,000 to \$50,000), because of the cost of administering, paying and reporting to a multitude of small mortgage investors.

For the small investor, then, another medium of mortgage investment is necessary. Proposals have been made and a few companies have been established to buy N.H.A. mortgages and issue debentures, which would be sold to the public in small denominations. Such a development of a multitude of mortgage investing companies, would be an undesirable development in the Canadian capital market. Their development would

be undesirable because -

(a) The underlying credit would be the Government guaranteed mortgages exclusively. The rates and yields at which their debentures would sell, would tend to vary, depending on the company's backing, and sales ability. This would lead to public confusion and suspicion of the underlying security.

(b) The cost of administering and operating such a company is sizeable (transfer agents, bond commissions, auditors' annual reports, etc.). This would result in a spread between the net yield on N.H.A. mortgages and the debentures offered being wide (at least $\frac{3}{4}\%$). The only way to minimize such expenses would be to establish huge mortgage companies, which might tend to monopolize the Government guaranteed mortgage field. The mortgage companies, acting as principal in new and old mortgages, would, as a national development, become the secondary market to the exclusion of independents.

A better solution would be for C.M.H.C. to market its own debentures in the way that the Federal Housing Administration in the United States operates. This would allow the C.M.H.C. to offer larger blocks of bonds than an individual company could, and would allow transfer and registration of the bonds in the same efficient way that the Bank of Canada operates. This method would be best for several reasons -

1. Offerings of C.M.H.C. bonds could be timed and scheduled to take into account Government and C.N.R. financing to take the best advantage of market conditions.
2. The cost of borrowing would be lower than having individual mortgage

SHORT TERM CAPITAL MARKET

This portion of the presentation is based on a need to assist Canadian corporations to minimize costs of borrowed money through their participation in a more efficient market for short term funds.

Our study with its concluding recommendations should benefit borrower and lender, alike:

1. By reducing the middleman spread in commercial banking, borrowing costs may be lowered and yield on investment capital improved.
2. More efficient middleman activity in the money market will provide the lender with better access to investment channels and add continuity to the market for borrowers. This could be achieved by a middleman active as principal and functioning as blending agent in melding borrowers' needs and investors' funds in a continuous, efficient market fashion.

The results of such a development would be savings for large "prime rated" corporate borrowers and lenders.

The Marketplace To-day.

1. Meeting Borrowers Needs

Two sources of funds are currently available to corporate borrowers, chartered bank loans at $5\frac{1}{2}\%$ "prime rate" (or higher), from the market - corporate savings for hire at rates varying $2\frac{3}{4}\%$ (demand) to $3\frac{1}{2}\%$ (90 days). During the past 5 years, money borrowed from the market on demand has averaged 1.5% cheaper than "prime" bank loan rate.

2. Problems in Satisfying Borrower Requirements.

Bank credit is relatively expensive and not altogether reliable over a period of time. Market supply of credit is available at lower but varying prices, in changing supply, for varying terms. In the marketplace, borrower demand and investor supply seldom meld for precise size and timing or for

mutually desirable terms. It is a common occurrence for even prime borrowers offering reasonable rates to have to wait as many as 4-5 days to borrow their requirements in the market.

3. A Need Exists for -

"Blending Institution" engaged in smoothing supply-demand factors on a continuing daily basis. This function would be aimed at alleviating market problems created by the influx of note offerings (borrower requirements) at times when supply of funds is insufficient for the moment, or by the influx of funds for investment when the supply of notes is inadequate. (The latter is less of a problem). Banks are unwilling to serve this function because it is opposed to their activity in advancing loans.

4. The Market Has Provided its Own Solutions, but with Undesirable Consequences.

(a) Emergence of agency agreements, has led to jobbers acting as principal in buying a corporation's notes up to an agreed upon maximum limit. In guaranteeing to buy a corporation's notes within a specified period of time. (i.e. 48 hours) the jobber has created the situation of a non-bank institution granting lines of credit to corporate borrowers against their fixed term promissory notes. This development is impeded by bank's refusals to accept commercial paper for call loan purposes. The jobber must then resort to non-bank sources of loan funds.

(b) Emergence of non-bank sources of funds

Corporations with funds to invest for short periods of time have

1
2
3
4
5 recognized this need of dealers to obtain loans secured by
6 commercial paper. Since banks refuse to grant such loans,
7 trust company and non-financial corporate sources of funds have
8 entered the market to fill the void left by banks. However, it
9 would be misleading not to observe that even if banks did advance
10 loans against commercial paper collateral, the rate would
11 likely be much higher than the yield of the collateral and job-
12 bers would seek to reduce carrying cost by borrowing from non-
13 bank sources when cheaper. This situation would undoubtedly
14 have existed during 1961-1962 to the present, but not during 1959 -
15 early 1960.

16 (c) Emergence of non-bank, non-resident sources of funds

17 U.S. Commercial banks have begun to enter Canada as country
18 bankers for earlier paper inventory. Rates compare favourably with
19 those of domestic non-bank lenders and funds are more reliable and
20 sizeable. The exchange hedge is handled by the lender.

21 Hypothesis -

22 If it is desirable to manage credit these developments are undesirable, in
23 that the wide diversity of non-bank credit and especially non-resident
24 credit is difficult to control.

25 It is desirable to direct this type of credit activity through a controll-
26 able, financial-type group, i.e. jobbers acting as middlemen perform-
27 ing a blending function dealing in commercial paper as principal with
28 machinery permitting such a development.
29
30

Elaboration of Market Problems

Corporate borrowers are essentially concerned with two borrowing considerations - loan cost, and reliability of loan source. During conditions of other than extreme credit stringency, banks have qualified as the most reliable source of credit. One might, therefore, consider that reliability is worth a price to the borrower, and, furthermore, that prime rates have fluctuated within a narrow $5\frac{1}{4}\%$ to $5\frac{3}{4}\%$ range, while market short term rates fluctuate widely - even sometimes exceeding prime rate (when banks curtail lending forcing borrower into the market for funds).

Nonetheless, during times of credit ease, and lowering money market rates without a comparable reduction in the bank's lending rate, the money cost spread penalizes the prime borrower borrowing from his bank to such an extent, as to force him from his bank to the market for more economical loans. During the past year, market money has been 40% cheaper than bank money. During the past 5 years, prime rate has averaged 5.6% and market money 4.1%, so one might conclude that the cost of bank reliability has been 1.5%. On this basis, there is little justification for a corporation Treasurer to remain with bank loans if this is his only purpose.

The banks are forced to reluctantly contribute to their embarrassment. Credit added to the economy through the banking system often pushed market rates low, even in the face of increasing corporate loan demand, thus aggravating the situation for the banks, while ensuring sufficient market funds to satisfy the borrowing needs of even the more marginal borrowers on both an attractive (cost) and reliable basis. The market has proven itself to be no less dependable a source of funds for prime borrowers during the past 5 years' period, than the banks themselves. Prime

1
2
3
4 borrowing corporations realise this, and banks realise this. Still no workable comm-
5 ercial paper market exists, nor have the banks permitted its existence.

6 The money market jobber, for competitive reasons, cannot ignore the
7 short term borrowing needs of prime corporations. The jobber will underwrite the
8 borrowers' requirements on a two-day delivery basis, and attempt to locate loans
9 (necessarily off-street loans) against those notes he is unable to place in the agreed
10 upon 2-day delivery period assuming market risks, transfer taxes and re-registration
11 problems. More than that, the jobber has translated a potential bank loan into deal-
12 er off-street loan. Since commercial paper is unacceptable collateral for bank loans,
13 the dealer is placed in a less favourable position to handle the loan than if the borrow-
14 er were, himself, to arrange temporary bank accommodation until market funds became
15 available.

16 This development impedes the placement of term notes on the market
17 because the term notes "float" in the market among "country-bank" corporate invest-
18 ors, as "dealer loans" on call at rates often above 60-day term note rates. The
19 dealer finds himself in the position of offering term notes at rates below that which he
20 must pay for loan accommodation, while he seeks a permanent buyer from among the
21 same corporations who, themselves, are the "country bankers"

22 It is not surprising that market rates for 30 to 90-day term paper tend to
23 disappear into a single level, subject only to fluctuations in the off-street loan rate.

24 We view these developments as highly disruptive to the maintenance of
25 an orderly money market structure. Furthermore, these developments threaten not only
26 the existence of the near term rate structure, but due to the size of "off-street loans",
27 threaten the entire market structure with the potent of concerted forced selling some
28 time in the future.
29
30

We consider these developments as having arisen from market inadequacies that we, herein, seek to have corrected.

The right of prime borrowers to cheapest available short-term capital.

Capital cost is an important item in product cost. Low cost production is a desirable aim if industry is to compete successfully in export markets or in domestic markets against low cost imports.

As with any cost consideration when money market rates decline significantly below banks' lending rate, borrowers will, and should, seek the source of the lowest cost short term capital. Canada has witnessed a 1½-year period during which time this commercial banking spread has exceeded 2% per annum when "prime" corporations have, or could have, borrowed all their requirements in the market at a 40% average saving over bank loans at "prime-borrower" rate.

Banks should not thwart this process by refusing to accept commercial short term note collateral.

Banks should assist the market processes by lending against paper at rates perhaps slightly above market rates, but certainly on a schedule geared more closely to market short term rates.

Developing Efficiency in the short-term capital market.

In Canada, investment dealers have earned a fine reputation for underwriting the capital requirements of business and industry. During the past 7 years, Canadian Money Market Jobbers have sought to demonstrate their willingness and preparedness for handling the underwriting and marketing of the short term capital needs of Canadian corporations.

To effect a truly two-sided short term market, certain preparations must be made -

1. Ontario & Quebec Transfer tax on securities shorter than 9 months or a year, must be eliminated. It is not sufficient to avoid such taxes by dealing in new forms of paper not specifically defined in the Transfer Tax Acts as "securities" for purposes of the Act. Furthermore, principal buying and selling on different dates or at different prices is subjected to tax on both the buy and sell transfer.
2. "Bearer Form" Registration for short term notes is necessary to permit fast un-complicated transfer of ownership.
3. Banking Facilities at reasonable cost is essential before a jobber, acting as principal, can undertake the purchase of notes for resale on his own account

These three points are basic to the establishment of a foundation for a two-sided market in commercial short term paper.

An additional measure should also be considered in respect of short term capital market. In this presentation, we shall term this institution "merchant bank".

Role of "Merchant Bank" in short term capital market.

This institution would perform a function between that of the presently defined "chartered bank", and that of the money market "jobber". Its clients would be primarily corporate borrowers and depositors.

Its powers would include the rights to -

1. Take deposits and pay interest on these deposits.
2. Lend to corporations against their promissory notes.
3. Act in foreign exchange and securities market for own and client accounts.

1
2
3 4. Accept and endorse corporate short term paper.

4 Functions of this Institution would approximate some, but not all of
5 those functions performed by trust companies. Its role would be to extend credit to
6 corporations indirectly by purchasing and maintaining inventories of corporate,
7 promissory and collateral trust paper for resale. Properly performed, its operation
8 would provide funds to prime borrowers at truly prime market rates.

9 The "Merchant Bank" would sharply curtail off-street dealer loan
10 activity by its function of itself financing the short term notes that now make up off-
11 street loan collateral. The Merchant Bank would earn its living by borrowing more
12 cheaply than it would lend. This is possible by "lending short, but borrowing
13 shorter".

14 Merchant Bank operation would not only reduce or eliminate off-
15 street loan activity - it would transfer it from many non-controllable, non-finan-
16 cial organizations to a few financial-type companies under the scrutiny of the
17 central bank.

18 Summary -

19 The currently existing need for an efficient short term market for
20 the temporary investment of corporate funds or for the provision of short term cap-
21 ital at economic rates is economically justifiable.

22 An interested jobber group is prepared and eager to "make" a
23 short term "capital" market providing the (Absent) second side of an efficient
24 two-sided money market.

25 Certain provisions must be made, and to this purpose we have made
26 briefly defined recommendations - among them the consideration of a "middleman"
27 or merchant bank.

and recommendations to your consideration.

1 JOHN R. CAMPBELL Q.C.

372 BAY STREET
TORONTO 1
CANADA

2
3
4 TO: Royal Commission on Banking and Finance

5 Gentlemen:

6 1. This submission relates to certain aspects
7 of mortgage financing under the National Housing
8 Act, 1954. It is concerned with secondary market
9 activity in N.H.A. mortgages and, more particularly,
10 the public and private distribution of securities
11 secured by N.H.A. mortgages to provide funds for
12 secondary market activity as well as new construc-
tion.

13 2. This submission is made in my personal
14 capacity as one who, since 1954, has been assoc-
15 iated with various investigations undertaken and
16 proposals made by investment dealers, Canadian
17 chartered banks and private interests concerning
18 secondary market activity in N.H.A. mortgages. I
19 have also acted as a lawyer in a substantial amount
20 of N.H.A. lending, including certain transactions
21 where the funds were provided from the sale of
securities.

22 SUMMARY

23 3. Most estimates fix future Canadian resid-
24 ential requirements at 125,000 to 150,000 new
25 dwelling units per year over the next ten years
26 and that a growing proportion of the new units will
27 be in various forms of multiple rental housing for
28 lower and middle income families. It is expected
29 that N.H.A. financing will be sought for a sub-
30 stantial proportion of this new construction and
that this will require from \$600 to \$900 million
N.H.A. funds per annum.

Royal Commission on Banking and Finance

1. This submission relates to certain aspects of mortgage financing under the National Housing Act, 1954. It is concerned with secondary market activity in N.H.A. mortgages and, more particularly, the public and private distribution of securities secured by N.H.A. mortgages to provide funds for secondary market activity as well as new construction.

2. This submission is made in my personal capacity as one who, since 1954, has been associated with various investigations undertaken and proposals made by investment dealers, Canadian chartered banks and private interests concerning secondary market activity in N.H.A. mortgages. I have also acted as a lawyer in a substantial amount of N.H.A. lending, including certain transactions where the funds were provided from the sale of securities.

3. Most estimates fix future Canadian residential requirements at 125,000 to 150,000 new dwelling units per year over the next ten years and that a growing proportion of the new units will be in various forms of multiple rental housing for lower and middle income families. It is expected that N.H.A. financing will be sought for a substantial proportion of this new construction and that this will require from \$600 to \$900 million

1 4. Current indications are that N.H.A. funds
2 in this volume will not be available from private
3 sources unless there is a new stimulus in N.H.A.
4 lending, failing which continued and increasingly
5 heavy direct Government lending will be necessary.
6 The usual private N.H.A. lenders are not keeping
7 pace with the requirements and in fact some have
8 discontinued N.H.A. lending altogether. Alternate
9 sources of N.H.A. funds have not developed to any
10 great extent nor has there been much secondary
11 market activity in N.H.A. mortgages. Areas of
12 special direct employment of C.M.H.C. funds such
13 as public housing, university residences, housing
14 for elder citizens will continue to make heavy
15 demands.

16 5. By improving certain of the terms of
17 lending, more private money will be available for
18 investment in N.H.A. mortgages and secondary market
19 activity will be stimulated. Because responsible
20 secondary market activity means greater liquidity,
21 even more private money will be willing to invest
22 in N.H.A. mortgages. Older institutions should
23 adapt and new institutions should grow to provide
24 funds to support both secondary market activity as
25 well as additional funds for new mortgages. Cor-
26 porate securities, backed by N.H.A. mortgages and
27 equity in new companies established for the purpose,
28 should prove more attractive to a broader group of
29 investors because the equity covers risks not
30 covered in direct investment, there is far greater
liquidity, there is no mortgage administration prob-
lem and shorter term investments can be made available.

6. Thorough investigation has indicated that
a company, organized to deal solely in N.H.A. mort-

4. Current indications are that N.H.A. funds in this volume will not be available from private sources unless there is a new stimulus in N.H.A. lending, but direct Government lending will be necessary. The usual private N.H.A. lenders are not keeping pace with the requirements and in fact some have discontinued N.H.A. lending altogether. Alternate sources of N.H.A. funds have not developed to any great extent nor has there been much secondary market activity in N.H.A. mortgages. Areas of special direct employment of C.M.H.C. funds such as public housing, university residences, housing for older citizens will continue to make heavy

5. By improving certain of the terms of lending, more private money will be available for investment in N.H.A. mortgages and secondary market activity will be stimulated. Because responsible secondary market activity means greater liquidity, even more private money will be willing to invest in N.H.A. mortgages. Older institutions should adapt and new institutions should grow to provide funds to support both secondary market activity as well as additional funds for new mortgages. Corporate securities, backed by N.H.A. mortgages and equity in new companies established for the purpose, should prove more attractive to a broader group of investors because the equity covers risks not covered in direct investment, there is far greater liquidity, there is no mortgage administration problem and shorter term investments can be made available.

6. Thorough investigation has indicated that a company, organized to deal solely in N.H.A. mort-

gages, can raise the capital required to support borrowings, which the market will dictate, for investment in new and existing N.H.A. mortgages, estimated at the outset to be \$300,000,000. By reason of various commitments received in respect of the administration of mortgage portfolios and the servicing of its debt, such a company can cover its operating expenses and provide the necessary reserves on a feasible basis. At many times during the last few years such a company could have borrowed substantial funds at rates which would have permitted its profitable operation. It is reasonable to assume the same for the future and that, therefore, additional capital would be obtainable as required. Competitive companies would no doubt also come into being and other comparable financings and operations undertaken.

7. Activities undertaken in the above described way could rapidly result in there being no overall shortage of N.H.A. mortgage money and hence work towards reducing interest rates. The Government could substantially end its heavy direct lending activity, except in remote areas, periods of tight money and other special situations. The Government could gradually (or periodically, rapidly) dispose of the large portfolio of mortgages held by C.M.H.C. The forward planning that could be done by builders and the economies in construction costs which could thereby be effected if long term forward mortgage commitments were available to builders could reduce the cost of housing.

8. In order to facilitate the foregoing, it is submitted that the Government should:

(a) Amend the existing unattractive parts of

1 the Act and Regulations such as: title
2 acceptability, certain aspects of the
3 insurance settlement, inability of
4 approved lenders to make loans as agents,
5 possible technical voidability of the
6 mortgage loan insurance policies; permit
7 builders to pay reasonable standby and
8 commitment fees.

9 (b) Provide for the sale of mortgages out of
10 the C.M.H.C. portfolio in amounts and on
11 terms which will prove acceptable to the
12 greatest number of potential buyers. Have
13 C.M.H.C. prepared to service the mortgages
14 it sells on a basis competitive with approved
15 lenders.

16 (c) Amend the Bank Act specifically to permit
17 chartered banks to make N.H.A. mortgages
18 at rates of interest from time to time
19 obtaining, notwithstanding other interest
20 rate limitations to which banks may be
21 subject.

22 (d) Standardize the insurance obligation on
23 all mortgages made under the 1954 Act,
24 primarily to raise the insurance obligation
25 to 100% on all N.H.A. mortgages.

26 (e) Amend the Canadian and British Insurance
27 Companies Act to permit securities based
28 on N.H.A. mortgages to be legal for life
29 without resort to the basket without the
30 necessity of registering the financing
documents against every title.

(f) Reserve C.M.H.C. direct lending to special
situations rather than continuing the large

1 volume of direct lending that has ob-
2 tained recently. Permit C.M.H.C. to
3 make low interest loans to approved
4 lenders for special situation N.H.A.
5 loans, Permit C.M.H.C. to be a buyer
6 of last resort of mortgages created for
7 resale.

8 MAIN BODY OF SUBMISSION

9 9. On the basis of economic studies of the
10 available information, it has been decided that
11 \$5,000,000 initial capital would be adequate to
12 support in the neighbourhood of \$300,000,000 of
13 short and long term borrowings, thus providing sub-
14 stantial new funds (in great part Canadian) for
15 investment in N.H.A. mortgages. The projections
16 of future operations indicated such substantial
17 growth possibilities that it appeared as if a new
18 institution established for the purpose could become
19 a responsible instrument in a secondary market for
20 N.H.A. mortgages and that other companies and
21 financial institutions would be encouraged to enter
22 the field in a competitive way. It is certainly no
23 part of this submission that any protection is sought
24 to provide any exclusivity in the field to any one
25 institution. In fact, full competitive opportunities
26 to any others interested is basic to this whole
27 matter.

28 10. The operating policy of such an institution
29 would be to deal only in first mortgages insured
30 under the National Housing Act, the main business
purposes of such company being:

1. To purchase and hold outstanding N.H.A.
mortgages.

volume of direct lending that has obtained recently. Permit C.M.H.C. to make low interest loans to approved lenders for special situation N.H.A. loans. Permit C.M.H.C. to be a buyer of last resort of mortgages created for

MAIN BODY OF SUBMISSION

9. On the basis of economic studies of the available information, it has been decided that \$5,000,000 initial capital would be adequate to support in the neighbourhood of \$300,000,000 of short and long term borrowings, thus providing substantial new funds (in great part Canadian) for investment in N.H.A. mortgages. The projections of future operations indicated such substantial growth possibilities that it appeared as if a new institution established for the purpose could become a responsible instrument in a secondary market for N.H.A. mortgages and that other companies and financial institutions would be encouraged to enter the field in a competitive way. It is certainly no part of this submission that any protection is sought to provide any exclusivity in the field to any one institution. The first principle of the submission is that any others interested is basic to this whole

10. The operating policy of such an institution would be to deal only in first mortgages insured under the National Housing Act, the main business purposes of such company being:

1. To purchase and hold outstanding N.H.A.

2. To assist in the creation of new N.H.A. mortgages.
3. To call a "trading" market in outstanding N.H.A. mortgages; and
4. As a result of the foregoing operations, to become the owners of a large and normally increasing volume of N.H.A. mortgages.

It is to be noted that such companies would not necessarily undertake the administration of the mortgages in their portfolios, but rather this service could be performed by existing approved lenders, including, to a great extent, the vendors of the mortgages, where they were approved lenders.

11. In dealing with a proposal for the financing of N.H.A. mortgages for new construction, the legality of commitment and standby fees in connection with N.H.A. mortgages becomes an important issue. Obviously at times when funds are available on a long term forward basis without the payment of commitment fees, no such fees would be charged; borrowers wouldn't pay them. However builders always have the freedom of choice between arranging long term forward commitments or just taking such amounts of mortgage money as may from time to time be immediately available and which they can then use. Most large builders questioned on the subject felt that the savings that may be effected by the long term planning permitted under forward commitments, certainly make normal commitment and standby fees worthwhile. Because certain approved lenders would make these larger loans as principals in the first instance, holding them for sale on completion, long

1 term forward take out commitments for the large
2 amounts of financing involved are necessary. As
3 with virtually every other kind of financing
4 involving long term commitments, the borrower is
5 normally required to make provision for reasonable
6 commitment and standby fees. Provision for the
7 payment of such fees is essential. If commitments
8 are to be provided for the purchase of completed
9 mortgages for as long as two years in advance,
10 approved lenders must be in a position to collect
11 commitment and standby fees. The amount of such
12 fees will naturally vary with the type of commit-
13 ment being sought; but in an open competitive
14 market no abuse is possible. Builders and develop-
15 ers are quite willing to pay such commitment fees,
16 as are necessary to provide the funds they require.
17 Many builders questioned on the subject feel that
18 they should have the right to decide themselves
19 on this question of commitment and standby fees.
20 The apparent objection to commitment and standby
21 fees is the view that they may be used to increase
22 the yields obtainable on N.H.A. mortgages over the
23 maximum interest rates chargeable. However, the
24 view favouring these charges is that the service
25 performed to the builder in making available for-
26 ward commitments is one that ought to be recognized
27 as being within the spirit of Regulation 20.

28 12. It is desirable for private enterprise
29 institutions to be actively involved in secondary
30 market activities in N.H.A. mortgages. However, it
may well be said that the existing rules favour only
Government activity in this field to the exclusion
of private enterprise. Among many opinions on
this point which various people have put forth, two

1 very clear points may be cited:

2 (a) Trust companies which are not other-
3 wise limited from so doing, are limited
4 by the National Housing Act from making
5 N.H.A. loans as agents for their clients.
6 They must undertake all new N.H.A. loans
7 they make as principals and their ability
8 to do this in volume is limited by their
9 own policies regarding the employment of
10 their capital and credit, which must be
11 employed to finance all their business
12 activities, not just the creation of
13 N.H.A. mortgages. They must hold the
14 N.H.A. loans they do make until completion
15 of all advances. In larger loans it often
16 takes more than a year for a loan to be
17 completed. Only then may they place or
18 sell these loans. If they were free to
19 make loans as agents, they could undertake
20 a large volume of placing loans on behalf
21 of investors who on their own do not,
22 nor are they even qualified, to make N.H.A.
23 loans. Many of such possible investors
24 who are not now involved in N.H.A. mort-
25 gages to any great extent, if at all, are
26 of the type that would undoubtedly trade
27 these mortgages from time to time in the
28 future.

29 (b) With respect to acceptability of title in
30 the event of a default and a claim being
made on the Corporation under the insurance
obligation, the terms of sale of the mort-
gages put up for tender by the Corporation
are more favourable than those upon which

Trust companies which are not otherwise limited from so doing, are limited by the National Housing Act from making N.H.A. loans as agents for their clients. They make as principals and their ability to do this in volume is limited by their own policies regarding the employment of their capital and credit, which must be employed to finance all their business activities, not just the creation of N.H.A. loans. They do make until completion of all advances. In larger loans it often takes more than a year for a loan to be completed. Only then may they place or sell these loans. If they were free to make loans as agents, they could undertake a large volume of placing loans on behalf of investors who on their own do not, not are they even qualified, to make N.H.A. loans. Many of such possible investors who are not now involved in N.H.A. mortgages to any great extent, if at all, are of the type that would undoubtedly trade these mortgages from time to time in the future.

(b) With respect to acceptability of title in the event of a default and a claim being made on the Corporation under the insurance obligation, the terms of sale of the mortgage put up for tender by the Corporation are such that the Corporation is not

1
2 it is feasible for a private vendor to
3 offer its mortgages for sale. C.M.H.C.
4 in effect warrants title acceptability
5 on their own mortgages. The provisions
6 of Regulation 50 constitute a very cogent
7 technical objection affecting the desir-
8 ability of N.H.A. mortgages as investments.
9 The fact that this is cured with respect
10 to mortgages offered for sale by the Cor-
11 poration merely serves to emphasize the
12 objection. It also seems to give these
13 mortgages an unfair advantage in the market
14 over other mortgages which might be available.

15 At present many mortgage and trust companies dealing
16 in N.H.A. mortgages find it necessary to bolster
17 N.H.A. mortgage portfolios with conventional mort-
18 gages, thus losing the advantage of the Government
19 covenant behind a total mortgage portfolio. The only
20 entity apparently able to take advantage of this under
21 the present rules seems to be C.M.H.C.

22 13. The original objective of the insurance
23 obligation was to influence more private lenders to
24 lend more money on the higher ratio loan to value and
25 longer term mortgages made under the National Housing
26 Act. It is probably fair to say that the 1954 Act
27 introduced the insurance obligation in an effort to
28 have mortgage investors relate their returns on
29 N.H.A. mortgages more closely to yields on comparable
30 term Government bonds than to returns available on
conventional mortgages. For normal housing loans
the maximum differential of 2¼ percentage points as
fixed by the 1954 Act was no doubt arrived at in
light of the expected market evaluation of the
insurance obligation in relation to government bonds.

For a period of time after the 1954 Act came into force there was a sufficient flow of funds at the rates of interest from time to time obtaining within the $2\frac{1}{4}$ percentage point formula. C.M.H.C. was not involved in heavy direct lending. It can therefore be assumed that the initial market evaluation of the insurance obligation was favourable, or at least sufficiently favourable to support a flow of private funds into N.H.A. mortgages adequate to meet the demand in most circumstances. The situation in the last few years has changed. Except for relatively short periods, there has existed for the last few years and, in an overall sense, there exists today a substantial shortage of institutional and other private funds for investment in N.H.A. mortgages. The reasons for this are apparently:

- (a) The growing overall shortage of investment capital in relation to demands in an expanding economy for investment capital and hence the competition for it.
- (b) A re-evaluation by a large part of the original N.H.A. market of the investment attractions of N.H.A. mortgages in light of comparison with other available investments.
- (c) And as a dislocating factor in the emergence of the above pattern, the entry into and then the withdrawal of the chartered banks from the N.H.A. lending field.
- (d) The failure to attract sufficient additional and new investment funds either directly or indirectly into the N.H.A. market.

One result has been that the Government, in order to help meet the continuing demand for housing, has found it necessary to make direct housing loans at the rate of approximately \$250-300 million each year. Another result has been that many projects which might have been undertaken have had to be delayed or forgotten. The amount of direct lending by government must be taken as a major indication of the extent of the overall shortage of funds. The following is a table showing the approximate amounts of money for N.H.A. mortgages by all approved lenders compared with C.M.H.C. since 1955.

Year	Approved Lenders (\$000,000)	C.M.H.C. (\$000,000)	Total (\$000,000)
1955	599	16	615
1956	388	19	407
1957	261	233	494
1958	510	373	883
1959	283	343	626
1960	232	161	393
1961 (est.)	327	275	602
Totals	2,600	1,420	4,020

It is to be noted that since the 1954 Act has been in force there has only been one major improvement in the terms of N.H.A. lending. That improvement was the removal of the so-called "2% bite" or co-insurance feature. Otherwise the insurance obligation has remained substantially the same, although there have been some minor improvements made from time to time in other respects.

14. While there have been variances within the 2½ percentage point spread in the relationship between the yields on long term government bonds and the fixed N.H.A. interest rate (See Schedule "A") it is difficult to determine whether a higher N.H.A. rate at any particular time would have been sufficient to produce more private funds. It is clearly desirable to keep the

One result has been that the Government, in order to help meet the continuing demand for housing, has found it necessary to make direct housing loans at the rate of approximately \$250-300 million each year. Another result has been that many projects which might have been undertaken have had to be delayed or forgotten. The amount of direct lending by government must be taken as a major indication of the extent of the overall shortage of funds.

THE FOLLOWING IS A TABLE SHOWING THE AMOUNTS OF MONEY FOR N.H.A. MORTGAGES BY ALL APPROVED

Year	Approved (1940-1941)	Approved (1942-1943)	Approved (1944-1945)
1945	299	16	612
1946	388	19	407
1947	261	238	193
1948	210	273	823
1949	288	343	626
1950	232	161	303
1951 (est.)	327	275	602
Totals	2,600	1,420	4,030

It is to be noted that since the 1954 Act has been in force there has only been one major improvement in the terms of N.H.A. lending. That improvement was the removal of the so-called "2% bite" or co-insurance feature. Otherwise the insurance obligation has remained substantially the same, although there have been some minor improvements made from time to time in other respects.

14. While there have been variances within the 2% percentage point spread in the relationship between the yields on long term government bonds and the fixed N.H.A. interest rate (see Schedule "A") it is difficult to determine whether a higher N.H.A. rate or any particular time would have been sufficient to produce more private funds. It is clearly desirable to keep the

1 N.H.A. interest rate down as low as possible. It
2 is also necessary to have the investment of private
3 funds in N.H.A. mortgages keep pace with demand.
4 It would appear that the availability of funds for
5 investment in N.H.A. mortgages is not solely a
6 function of interest rate. Generally, other import-
7 ant factors are:

8 (a) The market evaluation of the Government
9 insurance obligation,

10 (b) The terms of lending generally, and

11 (c) The liquidity of the investment.

12 This is not a question which is subject to easy
13 analysis. There are a number of institutional in-
14 vestors that originally made N.H.A. loans and who
15 might have been expected to continue and expand their
16 N.H.A. lending activities in a manner comparable to
17 other institutions who have continued active in the
18 field. Four or five institutions only, however,
19 continue their N.H.A. lending activity in any real
20 volume, although there are many lenders in the field.
21 Many institutions who were originally making N.H.A.
22 loans have substantially reduced or ended their
23 N.H.A. lending. At least one of these institutions,
24 which no longer makes N.H.A. loans, has expressed the
25 view that in light of analysis little, if any, value
26 may be attributed to the insurance obligation. It
27 therefore feels that it should get the going
28 conventional rate on the amount of the loan up to
29 the first 2/3rds of the valuation and say 12% per
30 annum on the excess. This would mean an interest
rate of around 8½% on a 90% loan. Any institution
which is otherwise limited to 66²/₃% loans and con-
scientiously attributes no value to the insurance

N.H.A. interest rate down as low as possible. It is also necessary to have the investment of private funds in N.H.A. mortgages keep pace with demand. It would appear that the availability of funds for investment in N.H.A. mortgages is not solely a function of the availability of funds and factors are:

- (a) The market evaluation of the Government insurance obligation,
- (b) The terms of lending generally, and

THE AVAILABILITY OF FUNDS

This is not a question which is subject to easy analysis. There are a number of institutional investors that originally made N.H.A. loans and who might have been expected to continue and expand their N.H.A. lending activities in a manner comparable to other institutions who have continued active in the field. Four or five institutions only, however, continue their N.H.A. lending activity in any real volume, although there are many lenders in the field. Many institutions who were originally making N.H.A. loans have substantially reduced or ended their N.H.A. lending. At least one of these institutions, which no longer makes N.H.A. loans, has expressed the view that in light of analysis little, if any, value may be attributed to the insurance obligation. It therefore feels that it should get the going conventional rate on the amount of the loan up to the first 2/3rds of the valuation and say 12% per annum on the excess. This would mean an interest rate of around 8% on a 90% loan. Any institution which is otherwise limited to 60% loans and consequently attributes no value to the insurance

1 obligation, should not make any N.H.A. loans. This
2 is exactly what many of these institutions are
3 doing.

4
5 15. The view has been expressed that the N.H.A.
6 interest rate as fixed by the Government affects
7 the interest rates set by financial institutions
8 for conventional first mortgage residential lending.
9 This is probably true to some extent. In theory the
10 insurance obligation should result in an interest
11 rate of from $1/4$ to $1/2$ of 1% less on N.H.A. mort-
12 gages than on conventional first mortgages. If
13 there exists a shortage of funds for N.H.A. mortgages,
14 but many lenders still have funds to invest in con-
15 ventional first mortgages, the conventional rate
16 will tend to stay at from $1/4$ to $1/2$ of 1% over the
17 fixed N.H.A. rate until the competition for conven-
18 tional first mortgages drives the rate down. This
19 situation exists only because of the reluctance of
20 lenders to make N.H.A. loans. If there were funds
21 equally competing for N.H.A. loans, that rate would
22 similarly be driven down by competition. The con-
23 clusion is that those lenders who remain active,
24 apparently continue to be satisfied with the
25 relationship between government bond and N.H.A. yields
26 or possibly have such a volume of funds for investment
27 that they must take advantage of N.H.A. mortgages as
28 an outlet. But because the lenders who are appar-
29 ently no longer satisfied with the relationship have
30 substantially gone out of the field, the published
statistics do not tell the whole story. And then
there is the added complication to any such analysis,
that direct government lending has increased. This
very substantially affects the usefulness of statis-
tics as an aid to interpret market evaluation. Only
if the interest rate on N.H.A. mortgages had been

1
2 free to vary during the period under review, and if
3 there had been substantially less direct lending by
4 the Corporation, would the statistics be of any
5 real assistance in analyzing the question of how
6 the market evaluates the insurance obligation.

7 16. It seems therefore that the yield available
8 on N.H.A. mortgages is only a really important factor
9 to those investors who either continue to evaluate
10 the insurance obligation favourably or have found
11 some method of providing a cushion against, as they
12 see it, the uninsured risks involved. Even if the
13 rate were free to go to say 8 or 9% or higher, this
14 alone would not necessarily produce the desired
15 funds. For one thing the expected rate of prepay-
16 ments to permit refinancing at lower rates would
17 discourage institutional lenders from getting
18 heavily involved; for another, larger institutions,
19 for public relations reasons, shy away from high
20 rate loans. But all that is hypothetical because
21 the Government would never permit such rates. The
22 continuing objective is to lower the rates while
23 continuing to attract adequate funds into the market.

24 17. The question is then what are the factors,
25 other than yield which affect the attractiveness
26 of N.H.A. mortgages as investments. This question
27 has been discussed with a number of investment
28 officers at various times. The experienced mortgage
29 investment officers approached the question in a
30 different way than did other investment officers,
but amongst all there was a divergence of view as to
the most important factors. The following is a list
of the factors most often mentioned, but because of
the divergence in the views obtained, no particular
order of priority has been attempted:

- 1 (a) There is the possibility that in the future the
2 Corporation might attempt to avoid its obligation
3 to pay under the Mortgage Loan Insurance Policy
4 because of title unacceptability. This could come
5 about notwithstanding that the mortgagee had
6 taken all reasonable precautions, including the
7 retaining of competent and experienced solicitors
8 at the time the mortgage loan was made. Regula-
9 tion 50 states that the Corporation will accept
10 title, which is satisfactory in "the opinion of
11 leading solicitors and notaries generally in
12 respect to the community in which the property is
13 situate". This is a test which is difficult
14 and impracticable to apply and no procedure is
15 laid down in the Regulations to cover the problems
16 of application. In the event of any dispute the
17 legal test of responsibility ought to be the law
18 of the province in which the property is situate.
19 The Regulations should contemplate the taking of
20 any available court proceedings to establish title
21 acceptability in the event of a dispute.
- 22 (b) Even if the mortgagee has caused to be made a
23 proper investigation of the title to the mortgaged
24 premises at the time that the mortgage loan is made,
25 future changes in the law respecting the validity
26 of titles could very well relieve C.M.H.C. of its
27 obligation to pay under the insurance obligation.
28 This does not raise the question of moratorium type
29 legislation, but rather changes in law (e.g. an appeal
30 court reversing a previously accepted lower court
decision) after the loan has been made. So long as
the lender did everything a prudent lender should
have done when making the loan and its solicitors
have dealt with any title questions on the basis of
the law as it then was, the lender should not be

1
2
3 penalized by future changes in the law over
4 which it has no control. The lender obviously
5 cannot subsequently release or otherwise impair
6 or alter the security (except as permitted by
7 Regulation 41) but it should be protected if it
8 has taken the usual careful precautions. If the
9 insurance obligation is to assist in making the
10 mortgage more tradeable, the point in time when
11 title acceptability should be relevant is when
12 the mortgage was made.

13
14 (c) In modern techniques of development and subdivi-
15 sion there is often included the imposition of
16 various kinds of restrictions and limitations.
17 Items questioned in this area, as well as other
18 title questions may well come within the class of
19 approved title defects or they may fall outside of
20 them, in which case it is necessary to establish
21 their acceptability. The method of establishing
22 the acceptability or inclusion of approved title
23 defects can be substantially improved so as to
24 provide lenders with a responsible degree of cer-
25 tainty covering questions of title.

26
27 (d) Section 7 of the Act states that a loan is insur-
28 able if it is made under some one or more of the
29 provisions of that section and also "on such terms
30 and in accordance with such conditions in addition
to those specified in the preceding paragraphs as
may be designated by regulation." Some experienced
mortgage investment people wonder if a building can
ever be completed in full technical compliance with
the Regulations. Certainly there is no practical
way for a mortgagee to satisfy itself on this point.
Inspectors employed by C.M.H.C. make their normal
checks during the progress of construction, but

penalized by future changes in the law over which it has no control. The lender obviously cannot reasonably require its borrowers to insure or alter the security (except as permitted by Regulation 41) but it should be protected if it has taken the usual careful precautions. If the insurance obligation is to assist in making the mortgage more troubleless, the point in time when title acceptability should be relevant is when

the mortgage was made.

- (c) In modern techniques of development and subdivision there is often included the imposition of various kinds of restrictions and limitations. Items questioned in this area, as well as other title questions may well come within the class of approved title defects or they may fall outside of them, in which case it is necessary to establish their acceptability. The method of establishing the acceptability or inclusion of approved title defects can be substantially improved so as to provide lenders with a responsible degree of certainty covering questions of title.
- (d) Section 7 of the Act states that a loan is insured if it is made under some one or more of the provisions of that section and also "on such terms and in accordance with such conditions in addition to those specified in the preceding paragraphs as may be designated by regulation." Some experienced mortgage investment people would say a building can never be completed in full technical compliance with the Regulations. Certainly there is no question as to a mortgagee's liability itself on this point. Inspectors employed by C.M.H.C. make that normal

1 their periodic or final approvals do not const-
2 itute, under the provisions of the Act and
3 Regulations, an admission by the Corporation
4 that everything has been done in full technical
5 compliance with the Act and Regulations. It is
6 possible, therefore, that the Corporation could
7 in the future avoid its obligation under the
8 insurance policy by raising some technical objec-
9 tion to the manner in which the building was
10 completed or the mortgage loan made, even though
11 a Mortgage Loan Insurance Policy was issued. Once
12 the policy has been issued it ought not to be
13 voidable.

14 (e) The cost of putting an insured loan on a mort-
15 gagee's books usually exceeds the cost of putting
16 a conventional loan on the mortgagee's books and
17 there are more administration, forms, etc. involved.

18 (f) The repayment privileges permitted under N.H.A. mort-
19 gages are more liberal than normally extended in
20 conventional lending. This has been partially
21 remedied by an amendment which permits multiple
22 housing loans by corporate borrowers to be non-
23 prepayable during the first ten years.

24 (g) In the insurance settlement, provision is made
25 for the payment of interest at the mortgage rate
26 for a six month default period. In many provinces
27 established mortgagors' rights make the completion
28 of foreclosure proceedings within six months almost
29 impossible. If the mortgagee conducts his collec-
30 tion and realization proceedings in accordance
31 with ordinary prudence and with all due despatch,
32 it would seem reasonable that interest at the full
33 rate should continue to be insured. Lenders would
34 accept a reasonable period, but six months is not

equity, is desirable. This is the theory behind the concept of institutions which will deal in and hold only N.H.A. mortgages and sell securities to finance the holding of such a portfolio. These securities should prove not only attractive to investors who would unlikely make direct investments in N.H.A. mortgages under any circumstances, but also to certain larger investors and the public who have little mortgage investment experience. One very important aspect of this type of financing is that it removes from the investor all responsibility for and concern about the administration of the mortgages. Also, it provides a cushion for possible future excessive foreclosure and other unexpected expenses. More importantly, the creation of a tradeable instrument permits a high degree of liquidity not available in direct mortgage investments. Such a form of security may prove so attractive as to lead to lower interest costs on the N.H.A. mortgages themselves.

19. The object of the legislation ought to be to facilitate the situation in Canada where the most possible investors have the freedom and incentive to invest and trade (directly, or indirectly via securities) in N.H.A. mortgages. The objective should be to provide a constant flow of private funds competing for the opportunity to invest in N.H.A. mortgages. It is then possible for the capital market to dictate satisfactory interest costs in light of the investment character and liquidity of the mortgage with little or no, or perhaps only periodic or special situation government regulation, interference or competition. It is therefore suggested that a new stimulus be given to private participation in N.H.A. lending; a stimulus which will cause private capital to re-evaluate the whole investment relation-

1
2 ship of N.H.A. mortgages to long term Government bonds
3 and other available investments. This can be achieved
4 by taking action to answer the existing objections to
5 the terms of N.H.A. lending. The improvements advocated
6 would have the additional effect of stimulating secondary
7 market activity. It is perhaps helpful to re-state the
8 main reason why the existence of a responsible secondary
9 market is desirable. It is simply that with the knowledge
10 that there will always be responsible buyers available
11 for such mortgage paper as investors may from time
12 to time wish to sell, more investors will be willing
13 to put more money into N.H.A. mortgages in the first
14 place. It logically follows that more approved
15 lenders and others will therefore participate in
16 lending activities than in the present unsatisfac-
17 tory state of affairs where only a very few lenders,
18 plus C.M.H.C. provide most of the N.H.A. funds.

19
20 20. There are, then, two basic conditions for
21 a successful secondary market operation in N.H.A.
22 mortgages: (1) rules which facilitate the easy and
23 orderly direct trading of mortgages, and (2) the
24 existence of some form of liquid and marketable
25 security which will facilitate the easy and orderly
26 indirect investment in and trading of mortgages. If
27 these two conditions exist, then it follows that
28 there will be substantially more lenders with sub-
29 stantially more money regularly available for invest-
30 ment in N.H.A. mortgages. Significant is the fact
that a broader group of more active lenders will be
interested in and competing for investments in a much
broader scale of N.H.A. mortgages than is now the
case. This will be important not only to buyers of
single family homes, but also to the builders and
developers and future occupants of various kinds of
multiple housing projects.

ship of N.H.A. mortgages to long term Government bonds and other available investments. This can be achieved by taking action to answer the existing objections to the terms of N.H.A. lending. The improvements suggested would have the additional effect of stimulating secondary market activity. It is perhaps helpful to restate the main reason why the existence of a responsible secondary market is desirable. It is simply that with the knowledge that there will always be responsible buyers available

for such mortgage paper as investors may from time to time wish to sell, more investors will be willing to put more money into N.H.A. mortgages in the first place. It logically follows that more approved lenders and others will therefore participate in lending activities than in the present unsatisfactory state of affairs where only a very few lenders, plus C.M.U.C. provide most of the N.H.A. funds.

20. There are, then, two basic conditions for a successful secondary market operation in N.H.A. mortgages: (1) rules which facilitate the easy and orderly direct trading of mortgages, and (2) the existence of some form of liquid and marketable security which will facilitate the easy and orderly indirect investment in and trading of mortgages. If these two conditions exist, then it follows that there will be substantially more lenders with substantially more money regularly available for investment in N.H.A. mortgages. Significant is the fact that a broader group of more active lenders will be interested in and competing for investments in a much broader scale of N.H.A. mortgages than is now the case. This will be important not only to owners of single family homes, but also to the builders and multiple housing projects.

1 21. By removing the objections which apparently
2 loom large in the minds of many investors, a whole
3 chain reaction of events logically follows. As
4 stated, there will be more money from more lenders.
5 This will mean that there will be competition for
6 the available loans, rather than the periodic acute
7 shortages of funds. Competition for loans will
8 result in the market governing the interest rates,
9 which will then tend to fall without direct regula-
10 tion. Interest rates, being realistically related
11 to the whole capital funds market, will more closely
12 follow bond rates. Central bank control of and
13 influences on the national financial situation will
14 then affect all segments of the economy more evenly.
15 Housing need not be singled out for special control,
16 but the special implements of control and influence
17 in the mortgage field may be retained for use only
18 in special circumstances. Heavy direct lending by
19 government ought only to be used as a stop-gap
20 measure, but a continuation of the recent trend
21 would soon establish it as an accepted method of
22 financing residential construction. It is quite clear
23 that the development of strong secondary market activity
24 will relieve the Government of the necessity of being
25 a heavy direct lender of funds and will provide over
26 the years an opportunity to the Government to sell a
27 substantial part, if not all, of its portfolio of
28 ordinary housing loans.

29 22. In a nation whose strength arises from the
30 independent spirit of its people, it is distressing
to have a governmental agency as the largest mortgagee
and hence potentially the largest landlord. In the
areas of housing and the financing of housing, there
are tremendous fields of operation for government
directly and via C.M.H.C., other than that of suppl-

21. By removing the objections which apparently

loom large in the minds of many investors, a whole

chain reaction of events logically follows. As

stated, there will be more money from more investors.

This will mean that there will be competition for

the available loans, rather than the portable nature

shortages of funds. Competition for loans will

result in the market governing the interest rates,

which will then tend to fall without direct regula-

tion. Interest rates, being realistically related

to the whole capital funds market, will more closely

follow bond rates. Central bank control of and

influences on the national financial situation will

then affect all segments of the economy more evenly.

Housing need not be singled out for special control,

but the special implements of control and influence

in the mortgage field may be retained for use only

in special circumstances. Heavy direct lending by

government ought only to be used as a stop-gap

measure, but a continuation of the recent trend

would soon establish it as an accepted method of

financing residential construction. It is quite clear

that the development of strong secondary market activity

will relieve the Government of the necessity of being

a heavy direct lender of funds and will provide over

the years an opportunity to the Government to sell

substantial part, if not all, of its portfolio of

ordinary housing loans.

22. In a nation whose strength arises from the

independent spirit of its people, it is disastrous

to have a governmental agency as the largest mortgage

and hence potentially the largest landlord. In the

areas of housing and the financing of housing, there

are tremendous fields of operation for government

directly and via C.M.H.C., other than that of supply-

menting the various private means of raising capital. One of these areas of operation is surely assisting in creating the investment climate in which the various private means of raising capital are used to full capacity. It is not advocated that C.M.H.C. either immediately or ultimately, completely withdraw from the field of direct lending. It should continue direct lending in outlying areas where it is unable to persuade private lenders to go or where it thinks private terms too difficult for the borrowers. It should continue to have the facility to make loans in periods of tight money, unemployment and in other situations where direct lending is necessary and desirable, but the exercise of this function ought to be substantially less necessary and certainly should be used more sparingly. The Corporation's resources would then be more available for the extremely important special government undertakings of public housing, housing for elder citizens, university residences and the various other desirable items that are often more effectively undertaken by government than by private financial institutions. The housing requirements of the future, at least for the next ten years, appear to be in the neighbourhood of 125,000 to 150,000 units per year. This means that from \$600 to \$900 million of mortgage funds insured under the National Housing Act will be sought each year. From all present indications the participation of private capital in mortgage finance under the Act will not keep pace with these requirements. It seems essential therefore that steps be taken to irradiate the reluctance of investors to go into N.H.A. mortgage investments.

23. The following recommendations for Governmental action are submitted for the consideration of this Commission:

- 1
2 1. Amend Regulation 50 to provide that the Corpora-
3 tion will not, in an insurance claim settlement,
4 object to title if it was satisfactory under the
5 law of the province in which the mortgaged premises
6 are situate at the time when the mortgage loan was
7 made. (Reference herein is made to Schedule A
8 hereto).
- 9 2. Amend Section 9 of the Act to provide for inclu-
10 sion in the insurance settlement of interest at
11 the mortgage rate for a longer period so long as
12 realization proceedings are being prosecuted with
13 due despatch. Also provide for the contribution
14 to the costs of realization on a basis which will
15 offer, particularly to smaller lenders, less risk
16 of bearing unusually large costs which may well
17 arise out of circumstances beyond their control.
18 (Reference is made to Schedule A hereto).
- 19 3. Amend Sections 3 and 6 of the Act and Regulation
20 47 to provide that approved lenders may make
21 N.H.A. loans as agents for investors. (Reference
22 is made to Schedule A hereto).
- 23 4. Amend Section 7 of the Act to provide that the
24 issuance of the insurance policy estopps the Cor-
25 poration from subsequently relying on building or
26 procedural defects incurred prior to the issuance
27 of the policy to avoid the obligation to pay under
28 the policy. (Reference is made to Schedule A
29 hereto).
- 30 5. Amend Regulation 20 so as to clarify that reason-
able commitment and standby fees may be collected
by an approved lender. (Reference is made to Sche-
dule A hereto).
6. Direct that C.M.H.C. be permitted to negotiate for

1. Amend Regulation 50 to provide that the Corporation will not, in an insurance claim settlement, object to title if it was satisfactory under the law of the province in which the mortgaged premises are situated at the time when the mortgage loan was made. (Reference herein is made to Schedule A hereto).

2. Amend Section 9 of the Act to provide for inclusion in the insurance settlement of interest at the mortgage rate for a longer period so long as the mortgage is outstanding. Also provide for the contribution to the costs of realization on a basis which will be determined by the mortgagee, but not of bearing unreasonably large costs which may arise out of circumstances beyond their control. (Reference is made to Schedule A hereto).

3. Amend Sections 3 and 6 of the Act and Regulation 45 to provide that approved lenders may make W.M.A. loans as agents for investors. (Reference is made to Schedule A hereto).

4. Amend Section 1 of the Act to provide that the issuance of the insurance policy issued by the Corporation from subsequently relying on building or procedural defects incurred prior to the issuance of the policy to avoid the obligation to pay under the policy. (Reference is made to Schedule A hereto).

5. Amend Regulation 50 so as to clarify that reasonable commitment and standby fees may be collected by an approved lender. (Reference is made to Schedule A hereto).

1 the sale of mortgages from its portfolio, even
2 although certain aspects of the tender system are
3 preserved as to price. Have C.M.H.C. in a position
4 to deliver mortgages in sufficiently large packages
5 (as well as in smaller ones) that as many potential
6 buyers as possible can be satisfied. Rather than
7 the flat fee servicing basis upon which C.M.H.C.
8 is prepared to service mortgages, have them
9 prepared to negotiate servicing contracts that
are competitive with other approved lenders.

10 24. In addition to the foregoing, the whole
11 question of chartered bank participation in N.H.A.
12 lending and secondary market activity in N.H.A. mort-
13 gages should be reviewed. Some of the banks have
14 recently come back into the N.H.A. lending business
15 in a relatively small way through trust companies. It
16 seems logical that others may follow, particularly
17 if an active and responsible secondary market were in
18 operation. Because perhaps up to 3,500 of the 5,500
19 odd bank branches throughout the country could acti-
20 vely function as mortgage outlets and mortgage ser-
21 vicing offices, it is desirable to have broad chartered
22 bank participation in the N.H.A. lending program. Our
23 chartered bank branch system is unique in its facility
24 to participate in and serve the N.H.A. mortgage lend-
25 ing business. In addition to their physical and
26 personnel attributes, they exert a large sphere of
27 influence in investment matters. If banks could make
28 and service loans as agents, they could from time to
29 time introduce new funds of others, as well as their
30 own, into N.H.A. lending and they could assist others
in the creation and servicing of new loans. Their
servicing facilities would also be available on a
competitive basis in secondary market activities.

1 25. It seems that the reluctance on the part of
2 the banks to participate directly in new lending
3 might well be overcome by an amendment to the Bank
4 Act, comparable to the amendment of several years
5 ago to the Canadian and British Insurance Companies
6 Act, confirming the legality of N.H.A. mortgages as
7 investments. Notwithstanding the specific authority,
8 as set forth in Section 3 of the National Housing
9 Act, to approved lenders to make N.H.A. mortgages,
10 the Canadian and British Insurance Companies Act
11 does specifically make N.H.A. "legal for life without
12 resort to the basket provisions". It would seem
13 appropriate therefore to amend the Bank Act in a
14 comparable way. This would then free those char-
15 tered banks who are doing their N.H.A. lending act-
16 ivities through trust companies to do them directly,
17 if they so chose. It would undoubtedly lead to a
18 growing bank participation in N.H.A. lending
19 activity without further consideration of the some-
20 what, at least to the layman, confusing question of
21 banks lending money at rates in excess of 6% per
22 annum. If some banks were to recommence their direct
23 participation in the N.H.A. lending program, others
24 would be bound to follow. The question of the
25 power of approved lenders to make N.H.A. loans as
26 agents, rather than solely for their own account as
27 principals, is given additional importance and
28 urgency when the participation of banks is considered.
29 Their ability to assist in and finance the creation of
30 new loans on behalf of various classes of investors
is substantially simplified, and their authority for
so doing clarified, if the power of approved lenders
to make loans as agents is specifically spelled out in
the Act.

26. A responsible secondary market in N.H.A.

1 mortgages depends upon active trading, either
2 direct trading of mortgages or trading of securi-
3 ties backed by mortgages. The banks have substan-
4 tial portfolios of mortgages which, if competitively
5 qualified in the market, would be bound from time
6 to time to find their way into the market. To the
7 extent this occurred it would produce funds in the
8 hands of banks for new lending. Liquidity has
9 always been an important factor in the investment
10 programs of many, but particularly of banks. The
11 establishment of a responsible and active secondary
12 market for N.H.A. mortgages would certainly provide
13 the desired degree of liquidity and would strongly
14 influence wide participation by banks in secondary
15 market and new N.H.A. money activities. It is
16 therefore recommended that the Government give
17 serious consideration to having all amendments apply
18 to all mortgages made under the 1954 Act, including
19 the removal of the 2% co-insurance feature. Such
20 action would put all N.H.A. mortgages on an equal
21 footing for trading, except for interest rates and
22 maturities, as is the case with government and other
23 bonds. By reason of the fact that loans made with
24 the 98% insurance feature have been in existence
25 for some time and have had several years of payments
26 made thereon, the added contingent liability to the
27 insurance fund for making this move would likely
28 prove nominal.

29 27. As stated, it is not recommended that C.M.H.C.
30 should withdraw from direct lending entirely. There
will undoubtedly continue to be periods of time and
geographic locations where direct lending will continue
to be desirable in the national interest. In supple-
ment to governmental direct lending activity, it is
recommended that the basis of direct lending be

1 mortgages depends upon active trading, either
2 direct trading of mortgages or trading of securi-
3 ties backed by mortgages. The banks have substan-
4 tial portfolios of mortgages which, if competitively
5 qualified in the market, would be bound from time
6 to time to find their way into the market. To the
7 extent this occurred it would produce funds in the
8 hands of banks for new lending. Liquidity has
9 always been an important factor in the investment
10 programs of many, not particularly of banks. The
11 establishment of a responsible and active secondary
12 market in which mortgages would be actively traded
13 the desired degree of liquidity and would strongly
14 influence wide participation by banks in secondary
15 market and new N.H.A. money activities. It is
16 therefore recommended that the Government give
17 serious consideration to having all amendments apply
18 to all mortgages made under the 1934 Act, including
19 the removal of the 2% co-insurance feature. Such
20 action would put all N.H.A. mortgages on an equal
21 footing for trading, except for interest rates and
22 maintenance, as is the case with government and other
23 bonds. By reason of the fact that loans made with
24 the 98% insurance feature have been in existence
25 for some time and have had several years of payments
26 made thereon, the added contingent liability to the
27 insurance fund for making this move would likely
28 prove minimal.

29 As stated, it is not recommended that C.M.H.C.
30 should withdraw from direct lending entirely. There
31 will undoubtedly continue to be periods of time and
32 geographic locations where direct lending will continue
33 to be desirable in the national interest. In supple-
34 ment to governmental direct lending activity, it is
35 recommended that the basis of direct lending be

1 broadened and made more flexible by the introduc-
2 tion of special loans to approved lenders. Such
3 loans should be available on terms which will provide
4 an incentive to approved lenders sufficient to induce
5 them to make mortgage loans which they would not
6 otherwise make. Primarily the incentive should be
7 lower interest costs designed to compensate for
8 additional servicing costs. The joint loans that were
9 made prior to the 1954 Act also provide an indicated
10 method which proved successful in the past. It is
11 desirable to have as many methods of providing
12 financing for the making of N.H.A. loans as possible
13 in order that the various requirements of as many
14 sources as possible may be met. On this vein it
15 should be noted that it is desirable to have the
16 country's investment dealers brought into the N.H.A.
17 mortgage market activities on a better basis than is
18 now available to them. It is my contention that
19 investment dealers are more effective at dealing in
20 securities than in mortgages and that therefore they
21 would best serve N.H.A. mortgage secondary market
22 activity by selling securities based on mortgages.
23 However, they should not be limited to this field.
24 If C.M.H.C. could make commitments to be a buyer
25 of last resort of N.H.A. mortgages held by investment
26 dealers, then with confidence they could take on
27 more mortgages and hold them for sale. This would
28 similarly apply to companies set up to deal only in
29 N.H.A. mortgages. Temporary banking accommodation
30 would be more readily available until an issue of
securities could be marketed. On the several tenders
to date of mortgages for sale by C.M.H.C., on many
of the parcels there have been a number of bidders.
It seems quite apparent that a system of negotiated
sales could be established to fill the requirements

1 of many of these unsuccessful bidders. This is not
2 now available under the tender system in force.

3 28. With respect to the technical aspects of
4 securities of companies dealing only in N.H.A.
5 mortgages, it is desirable that such securities
6 be qualified as investments in which companies
7 registered under the Canadian and British Insurance
8 Companies Act may invest their funds or any portion
9 thereof, without availing themselves for that
10 purpose to the provisions of section 63(4) of that
11 Act. The collaterally secured obligations of such
12 companies are saleable, of course, on the basis
13 that they are secured by the pledge of the portfolio
14 of N.H.A. mortgages. However, the basis of the
15 opinion must rest on irrelevant provisions of the
16 Act, such as Section 63(1)(j)(i)(A), even although
17 it has no relation to the main security. The reason
18 for this is that for the collaterally secured
19 obligations to come within sub-section (h) they
20 must be "fully secured". All counsel canvassed on
21 this matter agreed that this contemplates the regis-
22 tration of assignments of mortgages, trust deeds,
23 supplementals, etc. against the title to every
24 mortgage acquired. Such registrations are, of course,
25 expensive and not feasible; hence the legality, for
26 opinion purposes, must rest on technical qualifica-
27 tion within a section not relevant to the business
28 aspects of the financing. Because of the foregoing,
29 a group desirous of entering this field acquired a
30 company which was a suitable vehicle by virtue of its
having paid the stated rate of dividend on its
preferred stock for more than five years. Some
qualification to this legislation which would permit
greater flexibility in the organization of companies
for secondary market operations is clearly desirable.

29. Not only can the various sources and methods abovementioned produce adequate funds for the secondary market activity, but they can produce sufficient funds so that there will be competition for new loans. This is bound to reflect in the interest charges on N.H.A. mortgages and tend to lower them. It is, therefore, most desirable that all those various factors be brought into play. When they have, as a second step, it is recommended that the Government free the interest rate chargeable on N.H.A. mortgages, because regulation should no longer be necessary. The main regulating factors then, would be current yields on Government bonds from time to time and special situation servicing costs. This should prove not only satisfactory to the market, but desirable from many standpoints. When investors come to relate the return on their direct or indirect investments in N.H.A. mortgages to the yields on government bonds, the spread will be narrowed and fluctuations confined within closer limits.

30. The foregoing are thoughts and recommendations with respect to a purely Canadian secondary market in N.H.A. mortgages. This is not to say that foreign investment capital would not from time to time be employed therein; no doubt such a money requirement would likely often look beyond our borders for satisfaction. However, the thoughts outlined are developed from and applied to the indicated pattern of development of our legislation, our financial institutions, our housing requirements and our national needs. The U.S. pattern of providing F.H.A. and V.A. mortgage loans is now briefly outlined in order to emphasize the differences in our respective overall situations as they have developed in this field. Under the United States

1 National Housing Act, the Federal Housing Adminis-
2 tration (F.H.A.) insures single family, multiple
3 family and many special assistance housing prog-
4 rams, including redevelopment, renewal, college
5 housing, housing for the elderly, nursing homes,
6 etc. Applications for these loans are made in a
7 way comparable to the application for a Canadian
8 N.H.A. loan. The significant difference is that
9 the fixed interest rate is not protected. Loans
10 may be made at a discount. A builder having
11 obtained F.H.A. approval of his subdivision applies
12 to F.H.A. through a local mortgage banker for an
13 undertaking to insure. When this undertaking has
14 been received, the mortgage banker (or broker) will
15 arrange to place the loan with a savings and loan
16 association, life insurance company, etc. at a
17 price. If this price is less than par, and most
18 often it is, this discount is passed to the builder.
19 The mortgage banker may not seek an institutional
20 commitment to take up the loan on completion at the
21 outset, but may carry it in its portfolio. In this
22 case, it usually seeks from The Federal National
23 Mortgage Association (F.N.M.A.) a standby commit-
24 ment for purchase on completion. Such a commitment
25 is normally from 1/4 to 1/2 of 1% under market and,
26 of course, will be taken up if the market has
27 worsened prior to completion of the mortgage and
28 its availability for delivery as a completed loan.
29 F.N.M.A. operates as a government agency stabilizing
30 the mortgage market by purchasing and selling F.H.A.
loans. On balance, it is a larger purchaser in that
it issues its own obligations to the public and to
the Treasury Department, the latter particularly in
connection with special assistance programs which are
financed at lower interest rates than are marketable

(i.e. 3-3/8% - 40 years). The F.H.A. guarantee in the event of default pays in 20 year Debentures bearing an interest rate, which is set at a rate comparable to the market rate of outstanding 20 year Government bonds at the time of guarantee of the mortgage and carrying the unqualified guarantee of the U.S. Government. F.N.M.A. purchases F.H.A. mortgages at a discount, currently 95 - 96 - 97 to par for special assistance programs, and requires the seller to purchase common stock in F.N.M.A. to the extent of an additional 1%, thus increasing its paid-in capital as it acquires mortgages. It is currently paying a dividend of \$3.24 per share annually and its stock is currently selling at about 84. Its general obligations, which are not guaranteed by the U.S. Government, mature in from six months to fifteen years and currently yield 2.76% to 4.09%. Due to its acquisition of mortgages yielding about 5.25% (face rate 5-1/4 less 1/2% servicing, purchased at 96, equals approximately 5.25% yield) and selling its obligations at substantially less, F.N.M.A. has a profitable operation. When the market for F.H.A. loans improves, F.N.M.A. sells its mortgages in an orderly manner to permanent institutional investors at prices somewhat over its initial purchase price, thus acting as a balance in the market. Currently, it is offering its F.H.A. single family loans bearing 5-1/4% interest at 99. In 1960 F.N.M.A. sold from its portfolio almost as many "seasoned" loans as it acquired in new loans. In 1961 it purchased several hundred million more than it sold. The mortgage market is now improving so that F.N.M.A. will again be a substantial seller of loans in 1962. Other "converters" of F.H.A. mortgages into other forms of obligations are

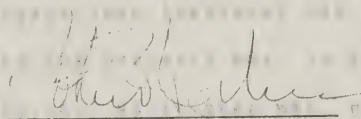

Nethercut & Young

Toronto, Ontario

A930

savings banks, savings & loan associations, commercial banks, through their time deposits, and more recently real estate mortgage investment trusts. Several such trusts have recently been formed, but all are based on the idea of substantially higher returns to the investor than the face rate of the mortgage, which is accomplished by borrowing on collateralized loans at lower interest rates and making uninsured land development loans and construction loans. Since no guarantees are made by these trusts and since they have so far been sold on the expectation of a higher, more speculative return, their affect on the mortgage market is still unknown.

Respectfully submitted,

John R. Campbell

TORONTO, April 13th, 1962.

SCHEDULE A

1 It is recommended that Section 50 of the
2 National Housing Loan Regulations be
3 amended to read as follows:
4

5
6 "50. The Corporation may, at its own
7 expense, cause a search to be made of the
8 title to the property and shall, within
9 thirty days of the receipt of a claim,
10 notify the approved lender whether or not
11 it has any objection to the adequacy of
12 title, provided that the Corporation shall
13 not object to the adequacy of such title
14 if at the earlier of the date upon which
15 the insured loan on the property was fully
16 advanced or the date upon which the policy
17 of mortgage loan insurance was issued, the
18 title to the property was, in accordance
19 with the law, as it then was, of the
20 province or territory in which the property
21 is situate, good and marketable without
22 defects, or good and marketable subject
23 only to any or all of the following defects:

24 (1) Defects in title specified or to be
25 specified in the policy of mortgage loan
26 insurance.

27 (2) Defects comprising some one or more of
28 the following:

29 (a) Violations of size, cost, setback or
30 use restrictions which do not provide
a penalty of reversion or forfeiture
of title, or a lien for liquidated
damages which may be prior to the in-
sured mortgage. Violations of such

SCHEDULE A

It is recommended that Section 50 of the
National Housing Loan Regulations be
amended to read as follows:

"50. The Corporation may, at its own
expense, cause a search to be made of the
title to the property and shall, within
thirty days of the receipt of a claim,
notify the approved lender whether or not
it has any objection to the adequacy of
title, provided that the Corporation shall
not object to the adequacy of such title
if at the earlier of the date upon which
the insured loan on the property was fully
advanced or the date upon which the policy
of mortgage loan insurance was issued, the
title to the property was, in accordance
with the law, as it then was, of the
province or territory in which the property
is situated, good and marketable without
defects, or good and marketable subject
only to any or all of the following defects:
(1) Defects in title specified or to be
specified in the policy of mortgage loan

(2) Defects comprising some one or more of

(a) Violations of size, cost, setback or
use restrictions which do not provide
a penalty of reversion or forfeiture
of title, or a lien for liquidated
damages which may be prior to the in-
sured mortgage. Violations of such

1 restrictions which do provide for
2 such penalties, provided such penalty
3 rights have been duly released or sub-
4 ordinated to the insured mortgage.

5 (b) Violations of a municipal restriction
6 on size, cost, setback or use that are
7 common to the neighbourhood in which
8 the mortgaged property is situated,
9 provided that the Clerk of the municipal-
10 ity confirms that the violations have
11 been common and that the municipality
12 has not taken action in respect of such
13 violations.

14 (c) Violations of a restriction on owner-
15 ship or occupancy based on race, color,
16 creed or national origin.

17 (d) Easements, servitudes or reservations
18 for public utilities along one or more
19 of the property lines and extending not
20 more than 10 feet therefrom and for
21 drainage or irrigation ditches along the
22 rear 10 feet of the property, provided
23 the exercise of the rights thereunder do
24 not interfere with any of the buildings
25 or improvements located on the mortgaged
26 property.

27 (e) Easements, servitudes or reservations
28 for underground conduits that do not
29 extend under any buildings on the mort-
30 gaged property.

(f) Mutual easements, servitudes or reser-
vations for joint driveways constructed
partly on the mortgaged property and

1 partly on adjoining property, provided
2 the agreements creating such easements
3 are of record.

4 (g) Encroachments on the mortgaged property
5 by improvements on adjoining property
6 where such encroachments do not exceed
7 1 foot, provided such encroachments do
8 not touch any buildings or interfere
9 with the use of any improvements on the
10 mortgaged property.

11 (h) Encroachments on adjoining property by
12 eaves and overhanging projections att-
13 ched to improvements on the mortgaged
14 property where such encroachments do not
15 exceed 1 foot.

16 (i) Encroachments on adjoining property by
17 hedges, wooden or wire fences belonging
18 to the mortgaged property.

19 (j) Encroachments on adjoining property by
20 driveways belonging to the mortgaged
21 property where such encroachments do
22 not exceed 1 foot, provided there exists
23 a clearance of at least 8 feet between
24 the buildings on the mortgaged property
25 and the property line affected by the
26 encroachment.

27 (k) Variations between the length of the
28 mortgaged property lines as shown on the
29 application for insurance and as shown
30 by the record or possession lines, pro-
vided such variations do not interfere
with the use of any of the improvements
on the mortgaged property and do not

involve a deficiency of more than 2%

with respect to the length of the front
line or more than 5% with respect to the
length of any other line.

(1) Encroachments by garages or improvements
other than those which are attached to or
a portion of the main dwelling structure
over easements for public utilities, pro-
vided such encroachment does not interfere
with the use of the easement or the
exercise of the rights of repair and
maintenance in connection therewith.

(m) Reservations of coal, petroleum, gas or
mineral rights.

(n) Liens or charges on the property for
accruing provincial income taxes or
municipal realty taxes, rates, charges,
assessments, local improvement rates or
assessments, including school, ecclesias-
tical and other general or special taxes,
or instalments on account thereof, not
due at the earlier of the date upon which
the insured loan on the property was fully
advanced or the date upon which the
mortgage loan insurance policy was issued.

(3) Defects comprising easements, restrictions,
reservations or encroachments, not coming
within the classes of defects enumerated
under subsection (2), as would not be
violated by the construction on the prop-
erty of a house or multiple family dwelling
in accordance with conditions under which the
insured loan thereon was made or by the reason-
able use of the property for residential pur-
poses.

1 The approved lender, at its option and
2 within ninety days, or such longer period
3 as the Corporation may approve, from the
4 receipt by it from the Corporation of
5 notice of objection to the adequacy of
6 title, shall either satisfy the objection
7 or withdraw the claim, provided that the
8 approved lender may not be required to
9 withdraw the claim so long as any proceed-
10 ings as to the adequacy of title are out-
11 standing in or before any court, master
12 of titles or land registrar of competent
13 jurisdiction. The Corporation may appear
14 in any such proceedings and if the law of
15 the province in which the property is
16 situate permits, may be a party to such
17 proceedings. The Corporation shall not
18 object to any defect in title arising sub-
19 sequent to the earlier of the date upon
20 which the insured loan was fully advanced
21 or the date upon which the policy of loan
22 insurance was issued so long as such
23 defect is not consequent upon any act of
24 the approved lender."

25 While the foregoing revision of Regulation 50
26 would regularize the contents of C.M.H.C.
27 Advice No. 43 into the Regulations and is
28 strongly recommended as establishing an accept-
29 able procedure for meeting some of the serious
30 difficulties experienced under the present
legislation, it is not the best solution to the
problems raised. The best solution would be one
which promoted secondary market activities.
Under either the present or the above proposed
scheme of dealing with title questions, subse-

quent purchasers of mortgages must still investigate and be satisfied with the title to each mortgage purchased. Hence the foregoing suggestion, while solving certain existing inconsistencies, does not attempt to promote secondary market activities. The only other presently available solution is for the seller of the mortgages to warrant title. Institutions seldom warrant title to properties they sell, hence in most instances separate title opinions are necessary. Warranting titles may be a satisfactory method of dealing with isolated transactions, but it will prevent any real activity in a secondary market.

Obviously, to make an N.H.A. mortgage freely tradable, the adequacy of title for Section 50 purposes should be established at the time the policy is issued. The only title item then which would remain outstanding during the term of the loan would be defects consequent upon the acts of an owner of the mortgage and these would not only be easily ascertainable, but also they are completely within the control of the owner of the mortgage. Although the carrying out of this suggestion may add somewhat to the administrative tasks of C.M.H.C., the consequent beneficial results to the development of a secondary market would completely justify the move. It is therefore strongly recommended that C.M.H.C. be requested to study methods of implementing this latter suggestion. In the meanwhile the within suggested revision of Section 50 of the Regulations would provide a very substantial and beneficial improvement over the existing situation.

2. It is recommended that clause (d) of sub-section (1) of Section 9 of the National Housing Act, 1954 be amended to read:

"(d) where the default period in respect of any amount specified in paragraphs (a), (b) or (c) is in excess of six months, additional interest at the mortgage interest rate on each such amount for the shorter of:

(i) the period of such excess, or

(ii) a period of eighteen months, if after the mortgage account had gone into default in an amount equal to three monthly payments of principal, interest and taxes where the loan is repayable monthly or in an amount equal to the quarterly, semi-annual or annual payment where the loan is repayable quarterly, semi-annually or annually, the approved lender holding or administering the loan, within the time prescribed by regulation, notified the Corporation of such default and took such steps in respect of such account as were satisfactory to the Corporation, provided that where the default period exceeds six months and in the opinion of the Corporation the person holding or administering the insured loan has not actively and with due despatch pursued the remedies available at law and under the mortgage, the Corporation may reduce

by two percentage points the amount of interest payable under this paragraph for the whole or any part of the period in excess of the first six months; and"

and that clause (e) of subsection (1) of Section 9 of the Act be amended to read:

"(e) an acquisition fee of one hundred and fifty dollars and such legal fees and disbursements as either:

(i) may be approved by the Corporation and acceptable to the approved lender, or

(ii) in respect of the foreclosure proceedings, have been taxed or otherwise fixed by the court, or a competent officer thereof, having jurisdiction in the foreclosure proceedings as the costs of such proceedings collectable by the approved lender from the mortgagor;"

3. It is recommended that Section 3 of the Act be amended by the addition to subsection (a) of the words "either as principal or agent" so that the subsection, as amended, will read as follows:

"(a) in accordance with this Act, either as principal or agent, make approved loans on the security of a first mortgage in favour of the lender;"

It would also be necessary to provide specifically that construction progress loans being made under the Act by an approved lender as agent

1 would be deemed to be insured loans. It is
2 therefore recommended that subsection (3) of
3 Section 6 of the Act should be amended to read:

4 "(3) When an approved loan is made by an
5 approved lender, either as principal
6 or agent, by instalments and the lender
7 has requested that the instalments be
8 insured under this Act, the aggregate
9 of the instalments approved by the
10 Corporation shall, if the insurance fee
11 in respect thereof has been paid, at the
12 request of the lender issue to the lender
13 or, if the loan is being administered by
14 an approved lender in accordance with the
15 regulations, issue to the person for whom
16 the loan is made, an insurance policy in
17 respect of the loan."

18 The foregoing would recognize that approved lenders,
19 so long as they have the power under the relevant
20 legislation affecting them, may make N.H.A. mort-
21 gage loans as agents for others.

22 It is further suggested that Section 47 of the
23 Regulations as it now reads become Section 47(1)
24 and that a new subsection (2) be added as follows:

25 "(2) Where an approved lender is prepared to
26 make an approved loan as agent for any
27 person other than an approved lender, the
28 approved lender acting as agent shall agree
29 with such other person to advance and ad-
30 minister the loan, or to arrange for another
approved lender to administer the loan,
until its maturity in accordance with the
Act and these regulations and to carry out

such administration in accordance with
normal mortgage practice."

4. It is recommended that Section 7 of the Act be
amended by the addition of subsection (4) as
follows:

"7(4) Notwithstanding anything in this Sec-
tion, after the Corporation has issued
an insurance policy in respect of a
loan, such insurance policy shall not
cease to be in force by reason of the
loan ceasing to be insurable within the
meaning of subsection (1), but shall
cease to be in force only if:

(i) it was obtained by fraud on the
part of the borrower;

(ii) it ceases to be administered by
an approved lender;

(iii) the right of recovery under the
mortgage securing the loan ceases
to exist other than by reason of
the acquisition by the person hold-
ing or administering the loan, of
the mortgaged property after default
has occurred under the mortgage;

(iv) the approved lender holding or ad-
ministering the loan fails, after
default has occurred under the mort-
gage, to claim payment from the
Corporation within the time pres-
cribed by regulation;

(v) a default occurs under the mortgage
and title is not conveyed to the

Corporation within the time
prescribed by regulation."

5. It is recommended that subsection (1) of Section 20 of the Regulations be amended by the addition of the following clause:

"(e) Where the borrower is a corporation, reasonable standby fees, commitment fees and other financial charges incurred in arranging the insured loan."

Then unless subsection (2) of Section 20 of the Regulations is deleted in its entirety, it would have to be amended to reflect the above, by the addition of the following words:

"except as permitted under paragraph (e) of subsection (1)."

Dealing further with subsection (2) of Regulation 20, it should be noted that Section 7 of the Act states that a loan is insurable if, inter alia, it was made on such terms and in accordance with such conditions..... as may be prescribed by regulation. Then Regulation 20(2) states "It is the spirit and intent of this section that".

From a lawyer's point of view, it is difficult to give a legal opinion on whether a loan is insurable when confronted with this kind of language. The language is so broad that it could theoretically affect the situation where the same borrower is obtaining both N.H.A. and conventional mortgages from the same lender.

It would seem that the real control of possible abuses of Regulation 20 is contained in subsection

Nethercut & Young

Toronto, Ontario

A942

1
2 (3) of the Regulation, where the Corporation
3 is given the right to refuse to issue an under-
4 taking to insure. The effectiveness of this
5 control lies largely in the co-operation given
6 to C.M.H.C. by the approved lenders. It is sugg-
7 ested that C.M.H.C. might, by an advice to appro-
8 ved lenders, make its position on Regulation 20
9 quite clear. It should do this after complete
10 discussions with Montreal Trust Company and The
11 Royal Trust Company who are the only two approved
12 lenders with both knowledge of and experience in
13 this phase of N.H.A. mortgage lending.

14 It is therefore recommended that subsection (2)
15 be deleted in its entirety from Regulation 20.

NHA & CONVENTIONAL MORTGAGE RATES COMPARISON OF YIELDS - 15 YEAR BONDS D/C - PROV.

NHA & CONVENTIONAL MORTGAGE RATES
COMPARISON OF YIELDS - 15 YEAR BONDS D/C - PROV.

March 13th, 1962.

BRIEF OF THE URBAN DEVELOPMENT
INSTITUTE (ONTARIO DIVISION) TO
THE ROYAL COMMISSION ON BANKING
AND FINANCE IN CANADA

1. The Urban Development Institute (Ontario Division) is an association of Land Developers and Consultants in the fields of subdivision engineering and town planning in the Province of Ontario. Further information concerning the purposes for which the Institute was formed is attached as Appendix "A" to this submission. The Members of the Institute, among whom are some of the most experienced land developers, consulting engineering and town planning firms in the province, appreciate the opportunity to express their views before this Royal Commission because of the vital importance to the land development industry of the subject under review.

SUMMARY OF RECOMMENDATIONS:

2. The land development industry has an essential role to play in the economy of Canada. The provision of suitable building lots for residential, commercial and industrial purposes has had, and will continue to have, an important influence on the growth of our urban centres and on the strengthening of our economy through the development of our national resources. For these reasons we wish to recommend:

- (1) THAT the down payment for NHA loans be reduced through an increase in the maxima by regulation and an increase in the percentage of loan to lending value. Similarly, a further change in the Insurance Act should be made to permit conventional mortgages in excess of the current 66 2/3% of lending value.
- (2) THAT to reduce the carrying charges on NHA loans, consideration should be given to an effective extension in the amortization period.
- (3) THAT the Bank Act be amended if necessary to permit the Chartered Banks to participate directly in NHA lending activity without regard to the current 6% interest limit.
- (4) THAT municipalities be permitted to borrow capital funds through the National Housing Act in order to install other municipal services in addition to trunk sewers and sewage disposal plants, on a local improvement basis re-payable through taxes.
- (5) THAT consistent long-term Federal Government policies with respect to the financing of land development and housing be revised so as to ensure a healthy and continuing investment climate.

March 17, 1962.

OFFICE OF THE MINISTRE OF
INSTRUMENT (ONTARIO DIVISION) TO
THE ROYAL COMMISSION ON BANKING
AND FINANCE IN CANADA

of land development and consultants in the fields of subdivision engineering and town planning in the Province of Ontario. Further information concerning the purpose for which the Institute was formed is attached as Appendix "A" to this submission. The Members of the Institute, among whom are some of the most experienced land developers, consulting engineers and town planning firms in the Province, appreciate the opportunity to express their views before this Royal Commission because of the vital importance to the land development industry of the subject under review.

2. The land development industry has an essential role to play in the economy of Canada. The provision of suitable building lots for residential, commercial and industrial purposes has had, and will continue to have, an important influence on the growth of our urban centres and on the strengthening of our economy through the development of our national resources. For these reasons we wish to recommend:

- (1) THAT the down payment for FHA loans be reduced through an increase in the maximum by regulation and an increase in the percentage of loan to lending value. Similarly, a further change in the Insurance Act should be made to permit conventional mortgages in excess of the current 80% of lending value.
- (2) THAT to reduce the carrying charges on FHA loans, consideration should be given to an effective expansion in the amortization period.
- (3) THAT the Bank Act be amended if necessary to permit the Chartered Banks to participate directly in FHA lending actively without regard to the current 5% interest limit.
- (4) THAT municipalities be permitted to borrow capital funds through the National Housing Act in order to install other municipal services in addition to trunk sewers and new water disposal plants, or a local improvement bonds to be repaid through taxes.
- (5) THAT consistent long-term Federal Government policies with respect to the financing of land development and housing be pursued so as to ensure a healthy and continuing investment

GENERAL COMMENTS:

3. The experience of the Federal Housing Authority in the United States, where Government mortgages are made available on the basis of a higher proportion of market value, with concomitant reductions in down payments, would suggest that a similar practice could be followed in Canada. The National Housing Act Regulations should, therefore, be reviewed if they are intended to serve their original purpose.

4. Despite the intention of mortgage lending under the National Housing Act to permit Canadians to borrow funds at low interest rates in order to build or purchase new homes, this purpose is not being served to-day. For example, in Metropolitan Toronto it is impossible for a Canadian with a salary of \$5,000. per annum - which is considerably in excess of the average income in Canada - to purchase a new home under NHA Regulations. Similar difficulties are experienced in all urban areas. This situation results, largely, from the increased cost of building lots through demands by municipalities for the installation of pre-paid services by the developer. The latter, in order to recover his costs, must include them in the sale price of the serviced lot.

5. The Gordon Report on Canadian Economic Prospects suggested that new housing in Canada would be required at a basic rate of 125,000 per annum. Such a programme could involve mortgage fund requirements at a rate in excess of 800 million dollars per annum. For these reasons, land development which of necessity sparks the house-building industry - representing more than 20% of all fixed capital in the country - has become and will continue to be one of the most important industries in Canada. In the tradition of private enterprise by which this country was able to grow, the land developer has always been an entrepreneur. As such, he buys land, employs professional assistance, risks his capital and provides the personal drive necessary to co-ordinate his development project before selling in the normal fashion of business economics. However, to operate successfully, an entrepreneur must be assured of long term money commitments. This point was recognized in the report published recently by the Royal Architectural Institute of Canada on "The Design of the Residential Environment" (Section 11⁴). The amendment of the Bank Act to permit the direct participation of the Chartered Banks in NHA lending without regard to the 6% interest limit would encourage a constant flow of private investment funds willing to compete for NHA mortgages. Land developers, as entrepreneurs, would then be permitted a greater freedom of choice than now obtains.

6. It is axiomatic that the ability of a private developer to hold land for long periods of time is a direct function of his capital resources, which obviously can never match those of Federal or Provincial Governments. The use of public funds for land development, as presently being administered by CMHC under Federal-Provincial land assembly projects, represents a subsidy which is not always directed to those in need of it. The Urban Development Institute, in a brief to the Federal Government (see Appendix "B" attached) has already recommended that if public funds invested in Federal-Provincial land assemblies were to be re-directed to help municipalities install trunk services, the proportional benefits to all tax payers would be far greater.

The experience of the Federal Housing Authority in the United States, and the experience of the Federal Housing Administration in the United States, are both available for the study of a housing program in Canada.

Despite the intention of mortgage lending under the National Housing Act to permit Canadians to borrow funds at low interest rates in order to build or purchase new homes, this purpose is not being served to-day. For example, in Metropolitan Toronto it is impossible for a Canadian with a salary of \$3,000 per annum - which is considerably in excess of the average income in Canada - to purchase a new home under FHA Regulations. Similar difficulties are experienced in all urban areas. This situation results, largely, from the increased cost of building lots through demands by municipalities for the installation of pre-paid services by the developer. The latter, in order to recover his costs, has to charge a high price for the lots.

The Gordon Report on Canadian Housing Projects suggested that new housing in Canada would be required at a basic rate of 125,000 per annum. Such a programme could involve mortgage and repayments at a rate in excess of 600

applies the house-building industry - representing more than 20% of all fixed capital in the country - has become and will continue to be one of the most important industries in Canada. In the tradition of private enterprise by which this country was able to grow, the land developer has always been an entrepreneur. As such, he pays land, employs professional assistance, risks his capital and provides the personal drive necessary to co-ordinate his development project before selling in the normal fashion of business economics. However, to operate successfully, an entrepreneur must be assured of long term money commitments. This point was recognized in the report mentioned recently by the Royal Architectural Institute of Canada on 'The Design of the Residential Environment' (Session 11). The amendment of the Bank Act to permit the direct participation of the Chartered Banks in FHA lending without regard to the 6% interest limit would encourage a constant flow of private investment funds willing to compete for FHA mortgages. Land developers, as entrepreneurs, would then be permitted a greater freedom of choice than now obtains.

It is axiomatic that the ability of a private developer to hold land for long periods of time is a direct function of his capital resources, which obviously can never match those of Federal or Provincial Governments. The use of public funds for land development, as presently being administered by CMHC under Federal-Provincial land assembly projects, represents a subsidy which is not always directed to those in need of it. The Urban Development Institute, in a report to the Federal Government (see Appendix "B" attached) has already recommended that if public funds invested in Federal-Provincial land assemblies were to be re-directed to help municipalities install trunk services, the proportional benefits to all taxpayers would be far greater.

7. In many cases, particularly in Ontario, the inability or unwillingness of municipalities to finance the provision of municipal trunk services in advance of building demands, has created artificial shortages of serviceable land. This, in turn, has resulted in disproportionate increases in the prices of raw and serviced land, and hence of the building lot. It is not surprising that the general public has reacted with shock and amazement on realizing that the cost of a new home is directly affected by the increase in the cost of serviced land. In the past ten years, land costs have risen by more than 200% ! (see Appendix "C" attached). On the other hand, the assurance that trunk services would be available in time to meet the growth requirements of any municipality could do more to curb inflation in the price of raw and serviceable land than any other factor in Government control. In this connection, the recent action by the Federal Government in amending the National Housing Act so as to establish low interest bearing funds for use by municipalities in the construction of trunk sewers and sewage disposal plants, is highly commendable. However, consideration should be given to the extension in the use of such funds for other municipal services.

8. Whilst it is of course conceded that direct government lending through CMHC is both necessary and desirable in those areas of Canada where private or other investment funds are not readily available, or in times of "tight money", there is a need to encourage a greater participation of private investment funds in housing loans. This could be achieved through the development of a strong secondary market for NHA loans. Subject to certain realistic changes and amendments to the regulations governing NHA approved loans, in order to ensure greater liquidity, the trading of NHA mortgages on a basis comparable to the trading in Government and other bonds would stimulate the Canadian capital market and ensure a flow of competitive investment funds for the further development of this country.

9. The strength of Canada lies in the free and independent spirit of its people. It is the ambition of all - or nearly all - Canadians to own their own homes: an investment which may be the most important to the individual Canadian, and to Canada.

All of which is respectfully submitted.

D. G. MacDonald
PRESIDENT

7. In many cases, particularly in Ontario, the inability or unwillingness of municipalities to finance the provision of municipal trunk services in advance of building demands, has created artificial shortages of serviceable land. This, in turn, has resulted in disproportionate increases in the prices of raw and serviced land, and hence of the building lot. It is not surprising that the General Public has reacted with shock and amazement on realising that the cost of a new home is directly affected by the increase in the cost of serviced land. In the past few years, land costs have risen by more than 200% (see Appendix "C" attached). On the other hand, the assurance that trunk services would be available in time to meet the growth requirements of any municipality could do more to curb inflation in the price of raw and serviceable land than any other factor in Government control. In this connection, the recent action by the Federal Government in amending the National Housing Act so as to establish low interest bearing funds for use by municipalities in the construction of trunk sewers and storm drains, is a most commendable step. It is suggested that similar funds be given to the extension in the use of such funds for other municipal services.

8. Whilst it is of course conceded that direct Government lending through CMHC is both necessary and feasible in those areas of Canada where private or other investment funds are not readily available, or in times of "tight money", there is a need to encourage a greater participation of private investment funds in housing loans. This could be achieved through the development of a strong secondary market for FHA loans. Subject to certain restrictions and amendments to the regulations governing NHA approved loans, in order to ensure greater liquidity, the trading of NHA mortgages on a basis comparable to the trading in Government and other bonds would stimulate the Canadian capital market and ensure a flow of competitive investment funds for the further development of this country.

9. The strength of Canada lies in the free and independent spirit of its people. It is the ambition of all - or nearly all - Canadians to own their own homes; an investment which may be the most important to the individual Canadian, and to Canada.

All of which is respectfully submitted.

URBAN DEVELOPMENT INSTITUTE (Ontario Division)

THE URBAN DEVELOPMENT INSTITUTE (ONTARIO DIVISION) IS AN ASSOCIATION OF ACTIVE LAND DEVELOPERS IN THE PROVINCE OF ONTARIO. THE INSTITUTE WAS FORMED IN 1957 IN RECOGNITION OF THE FACT THAT THE PROVIDING OF LAND FOR HOUSING AT A PRICE WITHIN THE MEANS OF THE AVERAGE PERSON, HAS BECOME A SERIOUS SOCIAL PROBLEM. ONE OF THE MAJOR DIFFICULTIES IN THE SOLUTION OF THIS PROBLEM HAS BEEN THE LACK OF A SINGLE RECOGNIZED CHANNEL OF COMMUNICATION BETWEEN LAND DEVELOPERS AND MUNICIPAL AND OTHER LEVELS OF GOVERNMENT SO AS TO PERMIT GREATER UNDERSTANDING AND COOPERATION IN MUTUAL PROBLEMS.

IN ORDER TO BE MORE REPRESENTATIVE OF FIRMS AND COMPANIES ENGAGED IN LAND DEVELOPMENT IN ONTARIO, THE INSTITUTE ACCEPTS AS ASSOCIATE MEMBERS CERTAIN SELECTED FIRMS IN THE FIELDS OF SUBDIVISION ENGINEERING AND TOWN PLANNING. THE INSTITUTE IS THUS ABLE TO SPEAK WITH A SINGLE VOICE IN THE INTEREST OF BETTER UNDERSTANDING WITH THE VARIOUS LEVELS OF GOVERNMENT, TO ENSURE CLOSER COOPERATION IN ALL MATTERS AFFECTING LAND DEVELOPMENT.

STATEMENT OF POLICY

In March of 1960 the Urban Development Institute (Ontario Division) received its Provincial Charter as a non-profit organization, having the following aims and objectives:

- (1) TO PROMOTE well planned communities by encouraging the reasonable and economic use of land.
- (2) TO PROMOTE efficiency and a high standard of ethics among persons and corporations engaged in land assembly and development.
- (3) TO PROMOTE understanding and co-operation between persons and corporations engaged in land assembly and development, and municipal planning, and other government authorities and agencies.
- (4) TO PROMOTE the availability of building lots at the lowest possible cost.
- (5) TO PROMOTE revisions in the tax structure so that land alone would not be required to produce the revenue necessary for educational and social services.

The Institute maintains a Central Office in Suite 29, Office Mezzanine, King Edward Sheraton Hotel. This Office is organized as a clearing house of information for the membership, and acts as a focal point between the members of the Institute and officials of all levels of government.

URBAN DEVELOPMENT INSTITUTE

(Incorporated in Ontario)

The Urban Development Institute of Ontario is an organization of active land developers in the Province of Ontario. The Institute was formed in 1957 in recognition of the fact that the providing of land for housing at a price within the means of the average person, has become a serious social problem. One of the major difficulties in the solution of this problem has been the lack of a suitable recognized channel of communication between land developers and municipal and other levels of government so as to permit greater understanding and cooperation in mutual problems.

In order to be more representative of firms and companies engaged in land development in Ontario, the Institute accepts as associate members certain selected firms in the fields of subdivision engineering and town planning. The Institute is thus able to speak with a single voice in the interest of better understanding with the various levels of government, to ensure closer cooperation

The Institute is a non-profit organization, having the following aims and objectives:

- (1) TO PROMOTE well planned communities by encouraging the reasonable and economic use of land.
- (2) TO PROMOTE efficiency and a high standard of ethics among persons and corporations engaged in land assembly and development.
- (3) TO PROMOTE understanding and co-operation between persons and corporations engaged in land assembly and development, and municipal planning, and other government activities and agencies.
- (4) TO PROMOTE the availability of building land at the lowest possible cost.
- (5) TO PROMOTE revisions in the tax structure so that land gains would not be required to produce the revenue necessary for community and social services.

The Institute maintains a Central Office in Suite 20, Office Mart, King Edward Hotel, 100 King Street East, Toronto. This office is organized as a clearing house of information for the membership, and acts as a focal point between the members of the Institute and officials of all levels of government.

Appendix "B"

RESOLUTION No. 3

SUBJECT: Land Assembly (Federal-Provincial)

SUBMITTED BY: A. J. Scott, President, Urban Development Institute.

ADDRESSED TO: Government of Canada (The Honourable the Minister of Public Works)

WHEREAS, development of land through Federal-Provincial Land Assembly Schemes was intended to provide serviced lots for housing at a reduced cost, the purpose of such schemes is frequently frustrated when finished lots are purchased on a first-come, first-served basis,

AND WHEREAS, certain financial considerations such as the purchase of the land by the partnership at a price below the existing market price, the omission of normal carrying charges such as would be met by a commercial land developer, and the absorption by CMHC of architectural and planning costs which a commercial land developer would need to charge against the project, results in the finished lots being sold at what represents a substantial subsidy per serviced lot which, on the basis of sales on a first-come, first-served basis is not directed to the persons normally considered to be in need of such assistance,

AND WHEREAS, the alternative sale of Federal-Provincial land, when ready for building, at public tender or in some other fashion so as to realize a portion of the profit obtainable, would thus result in the acquisition of funds, which, if subsequently channelled into the provision of trunk services in the community concerned, would have the overall effect of reducing the cost of serviced lots,

AND WHEREAS, if a portion of the profit, which could be realized through the sale of Federal-Provincial land assembly parcels at public tender or some comparable means, were thus applied in terms of trunk services in the community in which the assembly has taken place, a continuity in supply of lower cost serviced land would be assured in future.

THEREFORE BE IT RESOLVED:

(a) The sale of Federal-Provincial land by public tender, auction or some other basis calculated to result in a proportion, at least, of the profit involved in these operations being realized, would result in sufficient funds accruing to the Federal Government to finance the proposed installation of trunk services in the municipality in which the Federal-Provincial Land Assembly has taken place.

(b) The above resolution of the Urban Development Institute is endorsed and supported by the National House Builders' Association as an effective means towards the ultimate reduction in the price of serviced lots, thus giving to a larger segment of the population the opportunity to purchase a new home.

MOVED: A. J. Scott, Toronto

SECONDED: W. M. Thompson, Toronto

CARRIED: Executive Meeting of NHBA,
Quebec City, December 8th, 1959.

Land Assembly (Federal-Provincial)

ADDRESSED TO: Government of Canada (The Honourable the Minister of
Y: A. J. Scott, President, Urban Development Institute.

WHEREAS, development of land through Federal-Provincial
Land Assembly Scheme was intended to provide serviced lots for housing
at a reduced cost, the purpose of such scheme is frequently frustrated
when finished lots are purchased on a first-come, first-served basis

AND WHEREAS, certain financial considerations such as the
purchase of the land by the partnership at a price below the existing
market price, the omission of normal carrying charges such as would be
met by a commercial land developer, and the absorption by OMHC of archi-
tectural and planning costs which a commercial land developer would
need to charge against the project, results in the finished lots being
sold at what represents a substantial subsidy per serviced lot which,
on the basis of sales on a first-come, first-served basis is not directed
to the persons normally considered to be in need of such assistance,

AND WHEREAS, the alternative sale of Federal-Provincial
land, when ready for building, at public tender or in some other fashion
so as to realize a portion of the profit obtainable, would thus result
in the acquisition of funds, which, if subsequently channelled into the
provision of trunk services in the community concerned, would have the
overall effect of reducing the cost of serviced lots,

AND WHEREAS, if a portion of the profit, which could be
realized through the sale of Federal-Provincial land assembly parcels
at public tender or some comparable means, were thus applied in terms of
trunk services in the community in which the assembly has taken place,
a continuity in supply of lower cost serviced land would be assured in
future.

THESE POINTS BE IT RESOLVED:

(a) The sale of Federal-Provincial land by public tender,
either on some other basis calculated to result in
a proportion of the profit involved in
these operations being realized, would result in
to finance the proposed installation of trunk
services in the municipality in which the Federal-

(b) The above resolution of the Urban Development
Institute is endorsed and supported by the National
Home Builders' Association as an effective means
towards the ultimate reduction in the price of
serviced lots, thus giving to a larger extent to
the population the opportunity to purchase a new

4 1. The Security Analysts' Association of Toronto is
5 one of 28 member societies of the Financial Analysts
6 Federation. Two of these are in Canada and the rest in the
7 United States. Among the Federation's main functions is one
8 described in the constitution as follows: "To work toward
9 improvement in the quality and quantity of financial informa-
10 tion disseminated by corporations; to make and publish
11 surveys and studies with recommendations for improvement of
12 corporate financial reporting."

13 2. Analysts are interested in promoting better informa-
14 tion for several reasons. Two of the most important are:

15 1. Adequate information is essential to assess companies
16 and industries and hence their securities. If investors are
17 forced to appraise values on the basis of inadequate informa-
18 tion, they are more likely to make bad decisions and to lose
19 confidence in investing.

20 2. Good information, widely disseminated, promotes
21 broader interest in a security. As more investors become
22 interested in a stock or bond, it becomes much easier to buy
23 or sell that security, and both buyer and seller can have
24 more confidence that the price is fair. Development of
25 broader and more dependable markets for securities makes it
26 easier to finance projects in Canada and to promote still
27 wider ownership of existing companies.

28 3. Our Association considers the existence of adequate
29 corporate information to be of concern to this Commission
30

The Security Analysts' Association of Toronto is

one of 28 member societies of the Financial Analysts' Federation. Two of these are in Canada and the rest in the United States. 2. Analysts are interested in promoting better information for several reasons. Two of the most important are:

1. Adequate information is essential to sound companies and industries and hence their securities. If investors are forced to appraise values on the basis of inadequate information, they are more likely to make bad decisions and to lose confidence in investing.

2. Good information, widely disseminated, promotes broader interest in a security. As more investors become interested in a stock or bond, it becomes much easier to buy or sell that security, and both buyer and seller can have more confidence that the price is fair. Development of broader and more dependable markets for securities makes it easier to finance projects in Canada and to promote still wider ownership of existing companies.

3. Our Association considers the existence of adequate corporate information to be of concern to this Commission

1
2
3
4 because broader ownership of securities by Canadian individuals
5 and institutions is vital to the development of Canada's
6 business and industrial life on a sound basis.

7 4. The provisions of the federal and provincial
8 Companies Acts which set the minimum standards for much of
9 the information now available on Canadian companies, were
10 written, in the main, to protect minority owners from the
11 abuses that might result from the actions of the controlling
shareholders.

12 5. Our purpose is much broader. We do not quarrel
13 with the right of the majority to rule. We suggest, however,
14 that management and the controlling shareholders consider
15 minority shareholders as partners and provide them with
16 information that will allow them to be intelligently informed
17 about their company's affairs. Because this information is
18 made public to shareholders, it should also be made available
19 to all investors so that a more accurate appraisal of the
company's securities can be made.

20 6. We commend the Investment Dealers' Association of
21 Canada and the stock exchanges for their endeavours to secure
better standards of information.

22 7. Many companies, through enlightened self-interest,
23 are voluntarily going far beyond the legal minimums, by
24 providing better and more frequent information on their
25 affairs. However, we believe that some compulsion may be
26
27
28
29
30

needed to bring other companies up to adequate standards.

8. We propose to discuss the present state of information on publicly-owned companies under the following headings:

1. Annual Reports.
2. Interim reports.
3. Proxy information.
4. Prospectus information.
5. Jurisdictional problems.

9. In this brief, we cannot go into detail of all the aspects of the problem. However, here are some of the recommendations to which we wish to draw special attention:

1. Annual Reports:

(a) All companies should provide sales figures because this is a key figure in measuring management efficiency. Of 300 Annual Reports covered by a survey of 1960 reports of manufacturing, merchandising and distributing firms, only 30% supplied sales figures. Because this survey dealt with the leading firms in the main, the proportion for all Canadian companies is, undoubtedly, much lower.

(b) All company reports should provide comparative figures in the accounts, to provide a proper perspective in assessing company results. The standard here has greatly improved, but still leaves much to be desired. The survey of 300 reports showed that 59% gave all statements in a comparative form, 11% presented some statements in comparative form and

needed to bring other companies up to adequate standards.
8. We propose to discuss the present state of information on publicly-owned companies under the following headings:

5. Jurisdictional problems.

9. In this brief, we cannot go into detail of all the aspects of the problem. However, here are some of the recommendations to which we wish to draw special attention:

1. Annual Reports:

(a) All companies should provide sales figures

because this is a key figure in measuring management efficiency. Of 300 Annual Reports covered by a survey of 1960 reports of manufacturing, merchandising and distributing firms, only 30% provided sales figures. In the main, the proportion for all Canadian leading firms in the main, the proportion for all Canadian companies is, undoubtedly, much lower.

(b) All company reports should provide comparative

figures in the accounts, to provide a proper perspective in assessing company results. The standard here has greatly improved, but still leaves much to be desired. The survey of 300 reports showed that 50% gave all statements in a comparative form, 10% presented some statements in comparative form and

30% showed no comparisons at all.

(c) All companies which have committed themselves to long-term lease payments should give information about these future liabilities in their financial statements or the accompanying notes. We recognize that accountants do not agree on the best method of presentation, but in at least one case, involving millions of dollars of these future payments, no mention is made of the liability in the financial statements. In the 300-report sample, it was deduced that at least 68 firms were committed to long-term leases, yet 46 provided no details at all. Because this has become such a common method of acquiring the use of capital assets and, in some businesses, such a key source of funds, disclosure of the details of lease commitments should be mandatory.

(d) Accounts of all subsidiaries should be consolidated, the subsidiaries identified and the basis of consolidation set out. Some provinces already provide for this, but the federal and some provincial Companies Acts do not. Of 221 firms with subsidiaries, 74% consolidated all subsidiaries, 13% included some subsidiaries and excluded others and 13% left subsidiaries out of the statement. Relatively few provided information as to the basis of inclusion or exclusion of the accounts of subsidiaries. About 70% disclose the name of some subsidiaries and 56% name all subsidiaries.

30X showed no companies at all.

(c) All companies which have committed themselves

these future liabilities in their financial statements or the
accompanying notes. We recognize that accountants do not agree
on the best method of presentation, but in at least one case,
involving millions of dollars of these future payments, no
mention is made of the liability in the financial statements.
In the 300-report sample, it was deduced that at least 68 firms
were committed to long-term leases, yet 46 provided no details
at all. Because this has become such a common method of
reporting the use of capital assets and, in some businesses,
such a key source of funds, disclosure of the details of lease
commitments should be mandatory.

(d) Accounts of all subsidiaries should be consolidated.

to the basis of inclusion or exclusion of the accounts of
subsidiaries. About 70% disclose the name of some subsidiaries
and 50% name all subsidiaries.

1
2
3
4 2. Interim reports:

5 Shareholders in Canada should receive financial
6 information on their companies more than once a year.

7 To illustrate the general backwardness of financial
8 reporting in Canada, the Toronto Stock Exchange mailed a letter
9 to its listed companies in 1959 urging them to provide interim
10 (preferably quarterly) financial reports. The letter used was,
11 in essence, the letter used for the same purpose by the New
12 York Stock Exchange 33 years before, in 1926.

13 This attempt has had results that still leave much
14 to be desired. Of the 300 companies included in the survey
15 of Annual Reports, only 58 produce interim financial statements.

14 3. Proxy information:

15 When a shareholder in Canada receives notification
16 of a shareholders' meeting, about the only information he
17 receives with it, aside from a brief agenda, is a request for
18 a proxy signed in favour of management.

19 No provision is made in the form to allow him to
20 direct how his shares may be voted at the meeting. There is
21 also no space to appoint any other persons to vote his proxy.

21 We recommend:

22 (a) That the proxy material should contain much more
23 information and, in simple terms, details on the measures to be
24 discussed at the meeting so that the shareholder can vote his
25 proxy intelligently. In particular, it should include more
26

2. Interim reports

Shareholders in Canada should receive financial

information on their companies more than once a year.

To illustrate the general backwardness of financial

reporting in Canada, the Toronto Stock Exchange mailed a letter

to the listed companies on the 15th of January 1936.

(preferably quarterly) financial reports. The letter used was,

in essence, the letter used for the same purpose by the New

York Stock Exchange 33 years before, in 1903.

This attempt has had results that still leave much

to be desired. Of the 300 companies included in the survey

only 100 companies have furnished financial reports.

3. Proxy information

When a shareholder in Canada receives notification

of a shareholders' meeting, about the only information he

receives with it, aside from a brief agenda, is a request for

a proxy signed in favour of management.

No provision is made in the form to allow him to

direct how his shares may be voted at the meeting. There is

also no space to appoint any other persons to vote his proxy.

We recommend:

(a) That the proxy material should contain much more

information and, in simple terms, details on the measures to be

discussed at the meeting so that the shareholder can vote his

proxy intelligently. In particular, it should include more

1
2
3
4 information on the qualifications and financial interests of
5 the persons standing for election as directors.

6 (b) That the proxy form should give him the
7 opportunity of instructing management how to vote his shares
8 on individual measures being put before the meeting.

9 (c) That all proxy material be presented in an
10 unbiased way, so that it will be fair disclosure, not a selling
11 document to promote management's viewpoint.

12 4. Prospectus information:

13 On the whole, the disclosure of information in
14 prospectuses for new issues is satisfactory.

15 Some improvements are recommended, however. These
16 include more information on the salaries of executives and
17 material contracts affecting the business, disclosure of
18 beneficial owners of 10% or more of the voting stock and how
19 much they own, details of executive stock options, bonuses
20 and pension plans.

21 5. Jurisdictional problems:

22 We envisage that the long run solution to the
23 disclosure problems will be the voluntary acceptance of full
24 disclosure standards by all companies whose securities are
25 owned by the public. In view of the reluctance of some
26 companies to comply voluntarily, some compulsion may be
27 necessary.
28
29
30

1
2
3
4
5 10. There are three main types of organization through
6 which information standards might be improved:

7 (a) the Investment Dealers' Association of Canada,
8 which includes all the country's leading underwriting firms;

9 (b) the stock exchanges, and

10 (c) the federal and provincial governments, all of
11 which through Companies Acts (and in the case of the provinces,
12 through Securities Acts) set information standards.

13 If the Investment Dealers' Association and the stock
14 exchanges are not in a position to speed up the acceptance of
15 better disclosure standards by laggard companies, the
16 responsibility must fall on government.

17 11. The form which government legislation would take is
18 obviously beyond our field as analysts. However, having an
19 earnest desire to see some action result, we wish to suggest
20 some approaches that this commission might examine:

21 1. Legislation governing companies and securities should
22 contain requirements for high and uniform standards of dis-
23 closure. Failure to comply with these standards should be made
24 an offense.

25 2. Any solution to the problem should not involve
26 bureaucratic review of all material of all companies.

27 3. An aggrieved shareholder should be in a position to
28 require investigation by government officials leading to a
29 decision to prosecute or not.
30

10. There are three main types of organization through

(a) the Investment Dealers' Association of Canada,

(b) the stock exchanges, and

Memorandum on Annual Reports:

1. Annual Reports are one of the chief sources of material available to most shareholders and investors for use in assessing a company. Interim financial reports, annual meetings, prospectuses issued in connection with offerings of new securities and releases to the press on company developments all help to add to the sum of knowledge about a company's affairs. However, the Annual Report is, or should be, a basic and well documented picture of a company's affairs.

2. We are appending to this section a summary of reports of the Corporate Information Committee of the Financial Analysts Federation on standards for Annual Reports. This gives the detail that experienced analysts feel should be contained in a report.

3. We might point out that while the material listed looks almost self-evident, some reports do not even state what business the company is in, let alone provide the financial and other detail necessary for appraising the company and its securities. Investors should be able, through the Annual Report, to relate the company's performance to that of the industry as a whole. They should be given some idea of the effect of any government investigations or reports that have a bearing on the business. Full disclosure means providing all the facts relevant to the business.

Annual Reports are one of the chief sources of material available to most shareholders and investors for use in the preparation of their own reports. The information given in company reports is of new securities and releases to the press on company developments all help to add to the sum of knowledge about a company and well documented picture of a company's affairs. We are appending to this section a summary of reports of the Corporate Information Committee of the Financial Analysts Federation on standards for Annual Reports. This gives the detail that experienced analysts feel should be contained in a report. We might point out that while the material listed looks almost self-evident, some reports do not even state what business the company is in, let alone provide the financial and other detail necessary for appraising the company and its securities. They should be given some idea of the effect of any government investigations or reports that have a bearing on the business. Full disclosure means providing all the facts relevant to the business.

1
2
3
4
5 4. Sales information, for instance, is frequently with-
6 held by companies on the grounds that this information can be
7 used against them by their competitors. Competitors may be
8 attracted to a market, some companies say, if they can discover
9 from published sales figures what the size of the market is, or
10 what a particular company's share of the market is. Yet it is
11 possible to argue just as forcefully that new competition might
12 just as easily be attracted to a market because sales figures
13 are not published and because competitors over-estimate the
14 business available.

15 5. In most cases, probably, disclosing sales would not
16 really be a big factor in determining the effectiveness of
17 competition, because companies generally know fairly closely
18 just how much business others in the industry are doing. Hiding
19 sales figures, we suspect, is more a habit than a thoughtful
20 and well-reasoned decision by management. In the United States,
21 of 600 companies used in a survey*, 98% disclosed sales or net
22 sales in the income statement and U.S. industry manages to
23 survive.

24 6. Because only 30% of companies supply sales figures
25 in Canada, according to a survey of 300 companies**, an analyst
26 of Canadian securities usually has to work without this

27 * "Accounting Trends and Techniques", 1960 edition, published
28 by the American Institute of Public Accountants.

29 ** "Financial Reporting in Canada", 1961 edition, published by
30 the Canadian Institute of Chartered Accountants.

1 particularly useful tool for measuring a company's performance.
2 He is unable to make such basic checks of performance as
3 relating the trend in profit to the trend in sales, or the
4 trend in a company's sales to over-all industry sales, or the
5 trend in sales to the growth of the country.

6 7. We believe that by providing the facts called for
7 in the Financial Analysts Federation recommendations on Annual
8 Reports, companies will do a service not only to analysts and
9 the community, but also to themselves. Management, in this
10 era, must make plain the company's contribution to the economic
11 life of the country by showing that it is building a solid
12 enterprise, and by providing an adequate record of the
13 company's progress. In so doing, an efficient company will
14 also simplify its money-raising problems.

15 8. Reporting of Financial Institutions

16 1. It appears particularly appropriate before this
17 Commission to refer briefly to the reports of financial
18 institutions.

19 2. The Association notes with approval the generally
20 satisfactory Annual Reports of companies engaged in the instal-
21 ment finance business. Indeed, the reports of Industrial
22 Acceptance Corporation have, for a number of years, provided a
23 high standard of readability and disclosure comparing favourably
24 with companies in any other industry.

1
2
3
4
5 3. Unfortunately, such standards of corporate
6 reporting are not met by other areas of banking and finance.
7 Reporting by chartered banks, trust companies, loan companies
8 and investment companies leaves much to be desired. Shares
9 of chartered banks are widely held by investors and their
10 operations have wide-spread implications on the entire
11 economy. A comment upon inadequacies of chartered bank
12 reporting would appear well justified by this Association
13 since given the existing level of this reporting, the qualified
14 security analyst finds it impossible to do his job competently.

15 4. We will not attempt to describe in detail the
16 information which should be provided, but would mention a
17 number of general areas of information, most of which are
18 provided by United States commercial banks, which we consider
19 necessary to an intelligent appraisal of chartered bank
20 equities:

- 21 (a) Operating revenues showing major revenue sources.
22 (b) Operating expenses.
23 (c) Operating profits before transfers to internal reserves.
24 (d) Comparative data for previous year.
25 (e) Size of internal reserves.
26 (f) Interim reports (quarterly preferred).

27 5. Generally speaking, there is little to be desired
28 with the detail concerning balance sheet data, but information
29 provided in the income account (statement of undivided profits)
30

Nethercut & Young

A964

1
2
3
4 as prescribed under the Bank Act is inadequate by today's
5 accepted yardsticks of good corporate reporting. While there
6 were undoubtedly valid reasons for originally providing for
7 chartered bank reporting on its existing basis, there can be
8 little argument that times have changed, ownership of
9 corporations has become widely distributed and that a better
10 understanding of banking operations would further the
11 confidence of the public in our financial institutions.

Memorandum on Interim Reports:

1. There is no requirement under Canadian law or under the by-laws of any Canadian Stock Exchange or Investment Dealer Organization that requires publication of interim financial reports.

2. The Toronto Stock Exchange and the Montreal Stock Exchange in 1959 both circulated a request to listed companies to provide interim reports, preferably each quarter. There was some indication of interest, but most firms not providing these reports either refused outright or ignored the request altogether.

3. By contrast, all but 1% of the companies whose shares are listed on the New York Stock Exchange publish interim financial statements, and all but 6% publish these quarterly. The only firms which are exempt are companies whose operations depend on one crop a year (e.g. sugar, tobacco growers) and a non-operating steel and iron company which had leased its properties.

4. In Canada, of 300 manufacturing, merchandising and distributing firms whose Annual Reports were used in a recent study of financial reporting in Canada*, only 58 provide interim financial reports. Of these, only 31 publish them quarterly.

5. This means that shareholders of most Canadian companies must wait at least a year (and sometimes longer) for

* "Financial Reporting in Canada", fourth edition, 1961 published by the Canadian Institute of Chartered Accountants.

Memorandum on Interim Reports:

1. There is no requirement under Canadian law or under the by-laws of any Canadian Stock Exchange or Investment Council that companies should publish interim financial reports.

2. The Institute of Chartered Accountants in Canada (ICAC) in 1959 both circulated a request to listed companies to publish interim financial reports, and also issued a report on the subject. It was some indication of interest, but most firms not providing these reports either refused outright or ignored the request.

3. By contrast, all but 1% of the companies whose shares are listed on the New York Stock Exchange publish interim financial statements, and all but 6% publish these quarterly.

4. The only firms which are exempt are companies whose operations depend on one crop a year (e.g. sugar, tobacco growers) and a non-operating steel and iron company which had leased its plant.

5. In order to obtain a more complete picture of the situation, a study of financial reporting in Canada*, only 58 provide interim financial reports. Of these, only 31 publish them quarterly.

6. This means that shareholders of most Canadian companies must wait at least a year (and sometimes longer) for financial reports. This is in contrast to the practice followed by the Canadian Institute of Chartered Accountants.

1
2
3
4 a financial report on their firm's activities. Because the
5 annual results are frequently released three or four months
6 after the year end, much of this material is outdated,
7 particularly, if it refers to events in the early part of the
8 previous fiscal year.

9 6. We consider that this lack of interim information
10 is damaging to the interests of the shareholders and investors
11 generally and, in the long run, to the interests of the company.

12 7. Some companies fear that interim information will
13 somehow damage their competitive position. We can only point
14 to the remarkably successful firms whose names are prominent
15 among the firms which do report quarterly.

16 8. Some firms say that shareholders will get a distorted
17 picture from quarterly reports, because one season is busier
18 than another. Comparative figures for the previous year or
19 (as one company shows) for the previous five years, reduce
20 the effect of seasonal fluctuations in the comparison.
21 Another method is to show the previous 12-month total (e.g.
22 the first quarter of 1962 and the last three quarters of
23 1961).

24 9. A requirement for interim reports is probably
25 enforced best through the stock exchanges, as a condition of
26 listing. So far, however, the exchanges have not brought
27 themselves to the point of making such a rule. The Investment
28 Dealers' Association of Canada might require that companies
29
30

a financial report on their firm's activities. Because the annual results are frequently released three or four months after the year end, much of this material is outdated, particularly, if it refers to events in the early part of the

6. We consider that this lack of interim information is damaging to the interests of the shareholders and investors generally and, in the long run, to the interests of the company. Some companies fear that interim information will somehow damage their competitive position. 8. Some firms say that shareholders will get a distorted picture from quarterly reports, because one season is better than another. Comparative figures for the previous year or (as one company shows) for the previous five years, reduce the effect of seasonal fluctuations in the comparison. Another method is to show the previous 12-month total (e.g. the first quarter of 1962 and the last three quarters of 1961).

9. A requirement for interim reports is probably enforced best through the stock exchanges, as a condition of listing. So far, however, the exchanges have not brought themselves to the point of making such a rule. The Investment Dealers' Association of Canada might require that companies

1
2
3
4 whose issues are being underwritten by its members, give an
5 undertaking to provide interim reports. If neither of these
6 methods is workable, interim financial reports might be made
7 part of the required information under the Companies Acts.

8 10. Content of the interim reports need not be elaborate.
9 The main items to be covered should include sales and other
10 revenue, cost of goods sold, depreciation and depletion and
11 other write-offs, income and other taxes, and net profit.
12 Some balance sheet items would be helpful, particularly working
13 capital. The statements need not be audited. There should
14 be comparisons with the comparable period of the previous year
15 and the cumulative results for the fiscal year up to the end
16 of the period covered. If there are unusual changes up or
17 down, management should provide a brief explanation.

whose issues are being underwritten by its members, give an undertaking to provide interim reports. If neither of these methods is possible, a company is exempted from the provisions of the Companies Act, 1928, which require the directors to provide interim reports.

10. Content of the interim reports need not be elaborate. The main items to be covered should include sales and other revenue, cost of goods sold, depreciation and depletion and other write-offs, income and other taxes, and net profit. Some balance sheet items would be helpful, particularly working capital. The statements need not be audited. There should be comparisons with the comparable period of the previous year and the cumulative results for the fiscal year up to the end of the period covered. If there are unusual changes up or down, management should provide a brief explanation.

Standards for Annual Reports

Summary of Reports of the Corporate Information
Committee Financial Analysts Federation 1955-6,
1957-8, 1960-1.

A. ESSENTIAL INFORMATION:

1. Detailed Comparative Income Statements - Two Years

Sales; cost of goods sold; selling, general and administrative expenses; depreciation, depletion and amortization; other income; interest charges; income taxes and minority interest.

2. Detailed Comparative Balance Sheets - Two Years

Cash; marketable securities; receivables; inventories (including breakdown by stage of processing); investments; gross and net plant; accounts payable; taxes; loans; reserves (detailed); capital surplus; earned surplus; capital; dividend restrictions and sinking fund requirements.

3. Operating review of year

Discussion of sales trends, profit margins and financial position; new research developments; competitive position; foreign operations; basic policies and objectives of management; capital expenditures (detailed) and cash requirements; outlook and physical production.

4. Explanation of Accounting and Consolidation Methods

Inventory valuation method; depreciation and amortization method; foreign subsidiaries and extraordinary items.

Memorandum on Proxy information:

1. At the present time, regulation governing the form of the proxy instrument and information to be provided shareholders during proxy solicitation is that contained in the Corporations Acts of the provinces and the federal Companies Act (as amended). The provincial Securities Commissions have accepted these requirements for companies issuing securities under their jurisdictions, as have the stock exchanges in connection with companies whose shares have been accepted for listing.

The present proxy form generally in use in Canada is no more than the opportunity to give a vote of confidence to management. There is no provision, through space or explanatory note, for the appointment of an alternative proxy. There is no provision for the shareholder to oppose the appointment of directors. There is no provision for the shareholders to specify approval or disapproval of individual matters coming before the Board which require shareholder authorization. There is generally little, if any, description of these matters in any event. The whole procedure prevents any rational exercise of his franchise by a shareholder - in effect he either supports present management or loses his vote.

2. Since it is clearly evident that the existing legal requirements are insufficient to permit the intelligent exercise of a shareholder's vote, a matter of vital concern in our free enterprise economy, expansion of existing requirements pertaining to this matter is considered essential.

3
4 3. (111) In the United States proxy statements must provide a
5 considerable amount of information to the shareholder, some of
6 which we deem to be relevant and very desirable for incorporation
7 as required proxy procedure in appropriate Canadian statutes.

8 In brief, proxies requested from shareholders for an
9 annual or a special meeting should be accompanied by a state-
ment from the company giving:

10 (a) Method of proxy solicitation - disclosing use of paid
11 proxy solicitors, cost of solicitation and by whom it is to be
borne.

12 (b) Description of any beneficial interest of any director
13 or officer or his nominee in any matter to be acted upon at
14 the meeting.

15 (c) Pertinent details of voting securities and the record
16 date of security holders entitled to vote.

17 (d) Disclosure of the names of all parties beneficially
owning 10% or more of the company's voting stock.

18 (e) Information on the proposed directors whose election
19 is to be supported by the management-designated proxy-holders
20 as follows:

21 (i) principal occupation, corporate affiliations and
employment during the past 5 years;

22 (ii) individual beneficial interest in all equity
23 securities;

On the 11th day of March 1964, the Board of Directors of the Company, at its meeting held at the Company's offices, duly considered and approved the following resolution:

In brief, proxies requested from shareholders for an annual or a special meeting should be accompanied by a statement from the company giving:

(a) Method of proxy solicitation - disclosing use of paid proxy solicitors, cost of solicitation and by whom it is to be

(b) Description of any beneficial interest of any director or officer or his nominee in any matter to be acted upon at the meeting.

(c) Pertinent details of voting securities and the record date of security holders entitled to vote.

(d) Disclosure of the names of all parties beneficially owning 10% or more of the company's voting stock.

(e) Information on the proposed directors whose election is to be supported by the management-designated proxy-holders as follows:

- (1) principal occupation, corporate affiliations and employment during the last 5 years;
- (ii) individual beneficial interest in all equity securities;

(iii) details of any arrangement with other persons concerning the election; and

(iv) remuneration of any receiving, or expected to receive, \$25,000 in the year in any capacity, including details of all indirect remuneration including bonus, profit-sharing, stock options and pension benefits.

(f) Details of any indebtedness of any director or officer to the company.

(g) Details of any material transactions involving any director, officer or director-nominee to which the company was a party.

(h) Full, true and plain disclosure of details concerning any matter on which authorizing action is to be taken by the shareholders at the meeting.

4. The form of proxy itself should provide:

(a) a blank space in which the shareholder may, if desired, appoint as his proxy someone other than those designated by the management;

(b) suitable space for the shareholder to designate his vote for or against the proposed slate of directors, and

(c) suitable space for the shareholder to designate his vote for or against each proposal to be put before the meeting for shareholder authorization. These proposals to be identified for reference to the proxy statement where they are fully described.

Memorandum on Prospectus Information:

1. In a recent questionnaire to security analysts, it was found that the prospectus was second only to statistical services as the major source of financial information employed.*

Not only does the prospectus provide information vital to a proper evaluation of the new security issue which it describes but often it provides information on the issuing company which is not otherwise available to the investing public.

In view of the importance of prospectuses in providing information, particularly on new stock issues, a study of the adequacy of present regulations governing the content of prospectuses issued in Canada has been made by the Association.

2. Regulation of new security issues and, therefore, of prospectus requirements comes primarily under the various provincial Securities Acts. Most new issues are distributed at least in part in the Provinces of Ontario and Quebec and conformity with the Acts in these provinces is effectively the requirement for the majority of new security offerings. By the nature of their work, the Association's membership is not concerned with the speculative "junior" mining or oil

3
4 securities so this study is confined to industrial
5 securities.

6 3. The Securities Acts provide that primary distribution
7 of industrial securities can only be made after filing with the
8 Commission or other regulatory body, a prospectus which sets
9 forth certain specific information. For example, the
10 Ontario Act (Part VIII Sec. 39 (1)) lists 35 specific items
11 of information which must be provided. This information is
12 normally included in the last section of a prospectus under
13 the heading "Statutory Information".

14 4. The Securities Acts* also require that prospectuses
15 shall include financial statements consisting of a balance
16 sheet as at a date within 120 days of the prospectus' date and
17 an earnings statement covering the last five completed
18 financial years.

19 5. In addition to the required information, prospectuses
20 contain, as an introduction provided by the company to the
21 underwriters, certain material descriptive of its history,
22 operations and outlook. Provision of this information is
23 entirely discretionary, but in recent years, efforts by the
24 underwriters have substantially improved and expanded the
25 content of this material. It may be said that in the case of
26 most substantial established industrials, prospectus informa-
27 tion is satisfactory at present. Indeed, Canadian prospectuses
28 seem to provide a more readable document than those issued
29
30

3 under U.S. regulations and hence enable the individual
4 investor to obtain a better understanding of the security
5 offered. In the case of junior industrials, particularly
6 the initial public offering of equity in smaller, little-
7 known companies, however, it is felt that the supplementary
8 information is often sparse.

9 6. Uniformity of prospectus requirements in the different
10 provinces is, of course, very desirable and it is encouraging
11 to note that progress has been made toward establishing
12 uniformity in the various provincial Securities Statutes.

13 7. While it appears that the requirements of the
14 present Acts produce most of the vital information necessary
15 to judge a new issue, except for some additional points to be
16 covered later in this memorandum, the form in which financial
17 information is disclosed reflects the weaknesses in financial
18 reporting (see Memorandum). While the Securities Acts provide
19 that the financial statements required in a prospectus "be
20 drawn up in such manner and contain such information as the
21 Commission may from time to time require" the Association
22 feels that improvement in the quality of financial statements
23 should be obtained through improved Annual Reports rather
24 than by requirements of prospectuses. More adequate disclosure
25 in Annual Reports would undoubtedly be reflected in the form
26 in which financial statements are presented in prospectuses.

7. While it appears that the requirements of the present Act produce most of the vital information necessary to judge a new issue, except for some additional points to be covered later in this memorandum, the form in which financial information is disclosed reflects the weaknesses in financial reporting (see Memorandum). While the Securities Act provides that the financial statements required in a prospectus "be drawn up in such manner and contain such information as the Commission may from time to time require" the Association feels that improvement in the quality of financial statements should be obtained through improved Annual Reports rather than by requirements of prospectuses. More adequate disclosure in Annual Reports would undoubtedly be reflected in the form in which financial statements are presented in prospectuses.

1
2
3
4 8. The areas in which it is felt that present prospectus
5 requirements are insufficient are:

6 (a) Management remuneration - Present requirements showing
7 the total of remuneration to officers who individually receive
8 over \$10,000 per annum seems out of date considering that most
9 larger companies would have a number of junior officers above
10 that level. The requirement does not provide any disclosure
11 of the excessive payment to a chief executive which might
12 weaken a small company in that it does not disclose how many
13 executives participated in the aggregate remuneration disclosed.
14 The quality of management may often be judged by the spread in
15 remuneration between the top and second-line management.

16 In addition, remuneration of management is increasingly
17 by indirect means, such as stock purchase options, bonus or
18 profit sharing plans and retirement benefits. These can be as
19 important, or more so, than direct remuneration.

20 We propose that disclosure of remuneration provide
21 the total paid to the three highest-paid executives, the total
22 paid to all officers receiving above \$10,000 (as presently
23 required), the number included in this group and details of
24 all stock options granted to management along with the total
25 of bonuses and of pension provisions for the three highest paid
26 executives.

27 (b) Beneficial ownership - Present requirements cover
28 disclosure of ownership, in stock issues, of those in a position
29
30

8. The areas in which it is felt that present proposals

requirements are insufficient are:

the total of remuneration to officers who individually receive over \$10,000 per annum seems out of date considering that most larger companies would have a number of junior officers above that level. The requirement does not provide any disclosure of the excessive payment to a chief executive which might weaken a small company in that it does not disclose how many executives participated in the aggregate remuneration disclosure. The quality of management may often be judged by the spread in remuneration between the top and second-line management.

In addition, remuneration of management is increasing. In addition, remuneration of management is increasing. Profit sharing plans and retirement benefits. There can be as important, or more so, than direct remuneration.

We propose that disclosure of remuneration provide the total paid to the three highest-paid executives, the total paid to all officers receiving above \$10,000 (as presently required), the number included in this group and details of all stock options granted to management along with the total of bonuses and of pension provisions for the three highest paid executives.

(b) Beneficial ownership - Present requirements cover disclosure of ownership, in stock issues, of those in a position

1
2
3 to elect a majority of directors. This does not cover the
4 many instances where effective control of a company is held
5 through ownership, directly or by nominees, of something less
6 than 50% of the voting stock. We suggest that disclosure be
7 made of the names of all parties beneficially owning 10% or
8 more of a company's voting stock.

9 (c) Material contracts - Present requirements cover
10 disclosure of "the dates, parties to and general nature of
11 every material contract entered into within the two preceding
12 years" but not applying to contracts "entered into in the
13 ordinary course of business". In addition, particulars of
14 property purchased or acquired payable to some extent in
15 securities or from the proceeds of an issue, must be given
16 unless again this occurs in the ordinary course of operations.
17 These requirements appear to offer loopholes to companies who
18 carry on some real estate operations as transactions of a major
19 and very material nature can be ignored as being in the course
20 of business. The use of the term "general nature" has the
21 effect of not requiring details of the contracts and hence the
22 information necessary to judge the effect of such contracts is
23 not provided.

24
25 We recommend that a requirement be included in prospec-
26 tus content providing disclosure of details of any contract
27 during the two years involving amounts aggregating 10% or more
28 of a company's gross assets at the time of the contract.
29
30

to elect a majority of directors. This does not cover the
many instances where effective control of a company is held
through ownership, directly or by nominee, of something less
than 50% of the voting stock. We suggest that disclosure be
made of the names of all parties beneficially owning 10% or
more of a company's voting stock.

disclosure of "the dates, parties to and general nature of
every material contract entered into within the two preceding
years" but not applying to contracts "entered into in the
ordinary course of business". In addition, particulars of
property purchased or acquired payable to some extent in
securities or from the proceeds of an issue, must be given
unless again this occurs in the ordinary course of operations.
These requirements appear to offer loopholes to companies who
carry on some real estate operations as transactions of a major
and very material nature can be ignored as being in the course
of business. The use of the term "general nature" has the
effect of not requiring details of the contracts and hence the
information necessary to judge the effect of such contracts is

We recommend that a requirement be included in proposed
law content providing disclosure of details of any contract
during the two years involving amounts aggregating 10% or more
of a company's gross assets at the time of the contract.

1
2
3 9. While the regulations covering prospectuses and the
4 disclosure of information therein appear generally satisfactory,
5 they do throw a heavy burden on the staffs of the various
6 provincial authorities who administer the Securities Acts. The
7 increasing complexity of business and the growing volume of
8 corporate issues has taxed the capacity of the relatively small
9 staffs available for vetting prospectuses in most jurisdictions.
10 Larger qualified staffs would permit closer scrutiny of the
11 Statutory Information provided and would lead to disclosure of
12 more complete information, particularly in the case of "junior
13 industrials".

14 10. To help relieve the Provincial Securities Commissions'
15 staffs of unnecessary work and permit them to concentrate on
16 areas where the protection of the public is more likely, it is
17 suggested that the definition of "institutions" for private
18 placement exemption of prospectus filing be broadened to increase
19 the number permitted in such a placement and to include institu-
20 tions not presently considered exempt, such as pension funds,
21 investment trusts and special funds such as the Canada Council.
22 These buyers are well-qualified to obtain all information
23 necessary to a reasoned judgement of a security without the
24 protection provided by the prospectus" provisions. These
25 provisions often become financially burdensome to the financing
26 of small companies. It is recommended that exemption from
27 prospectus filing be extended to placements of up to 25
28

of prospective issuing bodies.

Memorandum on jurisdictional problems:

Two paragraphs from "Securities Regulation in Canada"
by J. Peter Williamson

Twenty-five statutes have a direct effect on the sale of securities in Canada. Each of the ten provinces has a securities act or security frauds prevention act, regulating the sale of securities in the province; (83) Alberta, Ontario and Saskatchewan have investment contract acts, regulating the issue of investment contracts in these provinces; (84) the Ontario Corporations Information Act and the Quebec Companies Information Act are very similar to securities acts and impose prospectus requirements on the sale of securities in Ontario and Quebec respectively; (85) and the companies acts of the Dominion and all the provinces except Ontario and Quebec and the Yukon Companies Ordinance, regulate the sale of securities by companies incorporated or licensed under them. (86).

Note 1

Securities regulation in Canada is a complex affair. The complementary and often overlapping provisions of companies and securities acts require careful search and detailed analysis, before anyone can be sure of a registration requirement or a possible source of liability. The lack of uniformity in both the companies and the securities acts is more than simply lack of identical requirements; it is a hodge-podge of miscellaneous provisions adopted more or less at random from the statutes of

Memorandum on Jurisdictional Problems;

Two paragraphs from "Securities Regulation in Canada"
by J. Peter Williamson.

Twenty-five statutes have a direct effect on the sale

of securities in Canada. Each of the ten provinces has a

securities act or security frauds prevention act, regulating

the sale of securities in the province; (83) Alberta, Ontario

and Saskatchewan have investment contract acts, regulating the

issue of investment contracts in these provinces; (84) the

Ontario Corporations Information Act and the Quebec Companies

Information Act are very similar to securities acts and impose

prospective requirements on the sale of securities in Ontario

and Quebec respectively; (85) and the companies acts of the

Dominion and all the provinces except Ontario and Quebec and the

Yukon Companies Ordinance, regulate the sale of securities by

companies incorporated or licensed under them. (86).

Note 1

Securities regulation in Canada is a complex affair.

The complementary and often overlapping provisions of companies
and securities acts require careful search and detailed analysis.

Before anyone can be sure of a registration requirement or a

possible source of liability. The lack of uniformity in both

the companies and the securities acts is more than simply lack

of identical requirements; it is a hodge-podge of miscellaneous

provisions adopted more or less at random from the statutes of

other jurisdictions, rarely amended, and scattered through the statute books more as an obstacle course to the legal profession than an effective protection for investors. (122)

The situation in the United States is a little worse because of the larger number of jurisdictions, and a little better, because of the dominant role of the federal government, and the progress made towards uniformity.

ROYAL COMMISSION ON BANKING
AND FINANCE

Hearings held at Toronto,
Ontario, on Monday,
April 16th, 1962.

THE COMMISSION

The Honourable Dana Harris Porter
Chief Justice of Ontario
Toronto, Ontario - Chairman

Mr. W. Thomas Brown, M.B.E.
Investment Dealer
Vancouver, British Columbia

Mr. James Douglas Gibson, O.B.E.
Banker
Toronto, Ontario

Mr. Gordon L. Harrold
Agriculturalist
Calgary, Alberta

Mr. Paul H. Leman
Corporation Executive
Montreal, Quebec

Mr. John C. MacKeen
Corporation Executive
Halifax, Nova Scotia

Dr. W.A. Mackintosh
Vice-Chancellor
Queen's University
Kingston, Ontario

Mr. H.A. Hampson - Secretary

Mr. Gilles Mercure - Joint Secretary

Toronto, Ontario,
16th of April, 1962.

THE CHAIRMAN: I shall call the meeting
to order. Mr. Allan.

HON. J. N. ALLAN: Chief Justice Forter
and gentlemen, I am here this morning on behalf
of the Prime Minister of the Province to indicate
to you, the members of this Commission, how
delighted we are that you are sitting in Ontario.
We want to especially welcome those who are not
residents of Ontario to our province.

We want to wish your Commission every
possible success and particularly we want to thank
you for your consideration in arranging to accept
the brief that will be presented by the province
later this summer. It is not ready now and we
are most grateful to you for your consideration
in that respect.

THE CHAIRMAN: Thank you very much, Mr.
Allan. We appreciate very much indeed your very
kind words of welcome and we shall look forward
to the Ontario brief at a later date.

The next brief is that of Geoffrey R.
Conway and Martin W. Goodman. Mr. Conway?

MR. CONWAY: Sir.

SUBMISSION OF GEOFFREY R. CONWAY
AND MARTIN W. GOODMAN

1 APPEARANCES:

2 Geoffrey R. Conway

3 Martin W. Goodman.

4 -----

5 MR. GOODMAN: Gentlemen, my name is
6 Martin Goodman. May I read the summary now?

7 THE CHAIRMAN: Yes.

8 MR. GOODMAN: There is a slight addition
9 which the Secretary had kindly allowed us to in-
10 clude.

11 --- Reads summary of brief.

12 THE CHAIRMAN: Questions?

13 COMMISSIONER BROWN: Mr. Chairman, I
14 wonder if I might open this discussion by asking
15 a general question which Mr. Goodman may wish to
16 discuss.

17 In your brief you use almost entirely
18 fiscal policy as a means of helping the economy
19 and there is virtually no mention of the efficacy
20 of monetary policy. I think the Commission would
21 be pleased if you would discuss why you did this
22 and also your ideas on whether monetary policies
23 have any effect.

24 MR. GOODMAN: Our main constraint about
25 discussing monetary policy was lack of time. That
26 is why we took pains to add that this is not all
27 we would prescribe. We feel that monetary policy
28 is equally valuable and should be equally emphasized
29 but because of the recent controversies of this
30 nature we felt it would probably get a thorough

1 airing before this Commission without our particular
2 attention to it. Since we had a lack of time to
3 go into it in detail we felt it best to leave it
4 out of the brief.

5 You are discussing monetary policy
6 totally and not just as it affects the flow of
7 funds or monetary policy for growth, inflation
8 measures, etcetera?

9 COMMISSIONER BROWN: Yes.

10 MR. GOODMAN: I think that this is an
11 area that should be stressed as much as possible.
12 On the other hand, I do not believe that it could
13 be effective by itself. We are concerned that
14 fiscal policy has been overlooked, for instance,
15 there is no reason why taxation rate reductions
16 and increases would not be an adequate government
17 policy to deal with recessions and inflation.
18 At the same time, the difficulty with monetary
19 policy according to the information that we added
20 is that if we reach a balance of payment crisis
21 which we expect, monetary policy forces or monetary
22 policy will be required to deal with this. Now,
23 if you accept the theory that for every goal the
24 government wants to accomplish it has to have a
25 tool, we need monetary policy as a tool to take
26 care of the balance of payments. This leaves only
27 other tools to deal with growth in the domestic
28 economy.

29 COMMISSIONER BROWN: Would monetary policy
30 be the only tool in the balance of payments problem?

1 MR. GOODMAN: Not at all, we have some
2 very specific problems that we left out.

3 COMMISSIONER BROWN: Why do you mention
4 that?

5 MR. GOODMAN: There are many aspects of
6 both booms -- there were many goals to deal with
7 balance of payments. Exports would be one goal.
8 By the same token a flow of funds would be another
9 goal and a flow of funds is one that monetary
10 policy would be particularly concerned with.

11 MR. CONWAY: Also at the present time
12 we have had an expansion of the money flow along
13 these lines. There have been moves by the govern-
14 ment to say it is not a fact at the present time
15 there is a shortage of funds for expansion of
16 the economy. There is probably a lack of direct
17 stimulus to make use of these funds. We have
18 therefore thought that part of the problem is
19 important to the matter of balance of payments
20 because in the government borrowings the problem
21 facing both federal and local governments is that
22 at the time that they look into the problem of
23 the balance of payments the only way not to have
24 an international crisis in their balance of payments
25 is probably for the federal government to go south
26 of the border and borrow funds there to finance
27 the federal deficit instead of staying in the short
28 term market in Canada. We prefer to see the federal
29 government staying out of the long term market at
30 the present time and leaving this to the provinces

1 and municipalities. We feel the problem of going
2 south of the border is the exchange rate and other
3 problems in making an issue below the border.

4 There are basic reasons in the monetary policy
5 why the federal government should leave its long
6 term as it is at the present time and if there
7 were not this pressure to go south of the border
8 to obtain long term funds but to obtain short
9 term funds in Canada it could be in the long term
10 an advantage.

11 We have not gone any further into this
12 problem because of the fact that we felt that
13 steps have been taken and that can be taken are
14 set out fairly detailedly in the other areas and
15 there is no point in going any further.

16 COMMISSIONER BROWN: Do you think that
17 monetary policy can stimulate the fund?

18 MR. CONWAY: If used in balance with
19 other factors, yes. If we did not have the flow
20 of funds in the economy or did not have the money
21 supply, did not have the other problems monetary
22 policy could finance the deficit and there would
23 be no difficulty. So this quite definitely would
24 be a necessary part. On the other hand, we stress
25 it again that possibly the government should have
26 done more as a specific policy to get a balanced
27 programme.

28 COMMISSIONER GIBSON: Mr. Chairman,
29 still on the very general question, I guess most
30 people admire people who come out and make specific

1 proposals. On the other hand, this is a very
2 complicated sort of country with a lot of
3 differences of view and it is not easy to do
4 specific things. I would very much like to know
5 the sort of background behind your proposals. You
6 come out with a lot of proposals but you do not
7 give us the picture of your philosophy and what
8 you are trying to do. You say there is something
9 wrong with the Canadian economy and it is drifting
10 in such an unsatisfactory way. Everybody knows it
11 is in an unsatisfactory state. This is not an
12 analysis that tells you what to do about it.
13 Would you say a little about your background
14 thinking on this?

15 MR. GOODMAN: There is, I thought, a
16 bit too much philosophy in the introduction. It
17 is true, we did not speak in some of the areas of
18 the economy like balance of payments but one we
19 warned of here because of what we feared is the
20 imminent danger from the United States from what
21 looks like a current balance but in reality is a
22 probable trade deficit.

23 Then, the unemployment situation, if
24 you take the goal of stable prices as being very
25 important and you draw a curve you will see at what
26 stage you will say at what stage are we going to
27 have stable prices but it seems to have been the
28 Canadian experience in the last two or three years,
29 certainly since the last two recessions that stable
30 prices keep coming out without too high an

1 employment percentage.

2 The growth rate, which in itself, can
3 be questioned - you can say "Why growth?" - well,
4 in growth, it is first that this will be a way
5 to tell the people in the country that some things
6 will operate to correct this growth rate, not
7 simply per capita but in current dollar payments,
8 some sort of stimulus is going to be required. We
9 feel that again the turn-off of investment in
10 Canada is one that would jeopardize your growth.
11 We can develop growth by fiscal and monetary
12 policy. Here we do not say the country is
13 toppling over now but it is at a plateau and
14 our advice is something is needed to make the
15 country move upwards again. This is the general
16 philosophy behind what we are saying on this sub-
17 ject.

18 COMMISSIONER GIBSON: Let me be a little
19 more specific. I think we are all aware of the
20 very broad complex you speak of but you put
21 emphasis on your programme of increasing the level
22 of investment at this particular time. This is
23 the time when there is a good deal of over-capacity
24 in federal unemployment and other economists per-
25 haps put more emphasis on trying to increase
26 consumption. It is this kind of question I am
27 hoping you will elaborate a little on as to why
28 you are all for investment but not much for con-
29 sumption.

30 MR. GOODMAN: The difficulty we found

1 here was the type of capital structure that we
2 have. The concern we have is that we have a
3 capital structure that is weak when it comes to
4 international winds. We seem to get the first
5 subsidiaries - American subsidiaries here are
6 turned off when a recession comes and when the
7 boom comes they are the last ones to get orders
8 as compared to the American parent companies.

9 What we feel we need is essentially a
10 more self-sufficient economy in the capital
11 structure. It is true we did not emphasize demand
12 in here. This is the other aspect if we were
13 dealing with the economy as a whole that we would
14 certainly emphasize.

15 Now, how do we get this better capital
16 structure. Either you can increase demand or
17 increase investment. As we point out, this is
18 a political argument. The difficulty you get
19 into is if you do not want to do it strictly with
20 deficits, therefore which one do you choose. In
21 this case I simply have chosen the investment
22 which will provide sufficient impetus to the
23 capital structure. The Canadian goods aspect is
24 another matter. We are not proposing a general
25 demand capital structure. You will possibly have
26 more of that later on. The demand is something we
27 would have liked to have really ^{known} / because we
28 were particularly concerned that the seemingly
29 large developments of the recent years do not seem
30 to have brought this about.

1 COMMISSIONER GIBSON: One of our under-
2 lying difficulties in these submissions is to try
3 and prove what the submission states. Are you
4 satisfied with the statements you made earlier
5 there that you have subsidiaries cut off here
6 first and when they start up they start up last,
7 so to speak. These may not be your exact words
8 but have you any evidence to support this view
9 because this is a very important matter?

10 MR. CONWAY: This is the type of thing
11 that you have brushes with in your knowledge of
12 the Canadian economy as such and you are assuming
13 that people concerned with it can argue about
14 circumstances here in Canada but you can only make
15 certain assumptions.

16 However, you do know that if the head
17 office of a company has operations throughout the
18 world or in one segment of the world their job
19 to the shareholders is to maximize profit. You
20 have to accept this and if we have a Canadian
21 economy that is not growing as rapidly as other
22 economies in the world and, as has been pointed
23 out, in certain fields the man who sits at the
24 head office determines the investment flow and he
25 is not going to be too interested in extending
26 his investment flow in an economy that is stagnating.
27 On the other hand, in Europe there is very rapid
28 expansion. The profit returns in recent years have
29 been in excess of 14 per cent in Europe as an
30 average whereas it is only ten per cent in both

Nethercut & Young

Toronto, Ontario

- 1334 -

1 Canada and the United States. The basic precept,
2 which I would hope we would accept, of a profit
3 maximization would mean that it could be expected
4 that the maximum investment flows would be to
5 Europe.

1 Therefore it is a matter of touching the
2 effort around the world. They are going to go to
3 Europe, so in this case the American subsidiary

4 instead of being most concerned how to change
5 their position in Canada, will naturally try and
6 do so in the facilities available, to have the
7 capital from head office. Being directed elsewhere,
8 then they may be without the wherewithal to try
9 and meet their local problems. To try and ^{quote}/specific
10 instance in specific companies is obviously im-
11 possible.

12 COMMISSIONER GIBSON: What I am getting
13 at is this. You are suggesting the sort of
14 general economic motivations in a society or
15 world where these things work out more or less
16 perfectly. I think the kind of thinking you are
17 putting forward is very well because in a general
18 way ^{but}/whether it actually works that way or not and
19 how much there are other factors enter into it,
20 I just wondered if you looked at it.

21 MR. CONWAY: The first assumption we
22 made in this approach was that in the first in-
23 stance we believe quite strongly that the attitude
24 of governments in a period when there is not a
25 crisis to provide jobs, cannot be to stand by and
26 hope that just natural forces will provide a
27 solution.

28 COMMISSIONER GIBSON: That is true, but
29 I do not think you should assume that certain
30 things happen just because they ought to happen

1 theoretically.

2 MR. CONWAY: That is correct. However,
3 on the other hand, we are not willing to assume
4 that because there is a chance you may not get
5 exactly the desired result, that you will not take
6 a certain move. You know from the way investment
7 decisions are made within corporations to a cer-
8 tain extent by individuals, that there are certain
9 types of tax laws, types of government action,
10 that may reassure people or move in a certain
11 direction. We don't know they will move in that
12 direction. On the other hand careful investigation
13 on these various lines is not devoid of informa-
14 tion. Certainly it is far better to take a step
15 that has a possibility of coming up with the
16 result desired rather than taking no step at all.

17 THE CHAIRMAN: What is the step?

18 MR. CONWAY: The steps we have proposed
19 here particularly, one of the major items was
20 referring back to consumptions ^{versus} / income. We
21 felt that here, if you apply more taxation to the
22 consumption side of the tax base --

23 THE CHAIRMAN: That means that you will
24 reduce demand.

25 MR. CONWAY: Not necessarily. There have
26 been quite a few surveys along this line. People,
27 it has been shown, tend to a certain basic demand;
28 their propensity to consume, shall we say, is at a
29 certain level. It is very difficult to alter this.

30 Granting that somebody who we wanted to

1 consume the same volume, if you increase your con-
2 sumption taxes it is going to cost you more. That
3 consumption is something fixed, the number of
4 dollars that you are going to have to consume a
5 little bit less in volume.

6 On the other hand we will take the third
7 one as balancing of your tax structure that does
8 not have too much incentive, and say if you put the
9 consumption tax on therefore that end is given a
10 hard time, to say that at the present time we
11 are taxing income excessively. This is our
12 feeling. We are not taxing income in balance.
13 If we bring these two items into balance, then
14 not only are you placing dollars in the hands of
15 the individual, his income taxes are lower, he
16 then has a choice. He can consume his thousand
17 dollars. If he does your demand in consumer
18 goods goes up. If instead he determines to in-
19 vest this, then supposedly your demand on the
20 investment sector goes up.

21 We still feel it is a matter of capacity.
22 If it is not too efficient capacity, the point is
23 you may need to spend money even though you have
24 not used the capacity to modernize your facility
25 to compete in world markets. If you provide limits
26 for companies to move in this line --

27 THE CHAIRMAN: You mentioned consumption
28 taxes.

29 MR. GOODMAN: We propose an increase in
30 the general manufacturers' sales tax of three per

1 cent.

2 THE CHAIRMAN: That is what you call
3 consumption tax?

4 MR. GOODMAN: Oh, yes.

5 THE CHAIRMAN: Well, of course, lots of
6 the provinces now have the sales taxes.

7 MR. GOODMAN: That is correct. At the
8 present time consumption taxes in Canada produce
9 less revenue than income tax in Canada, though
10 not by intention. We are concerned in quoting
11 a balance, and we have an example, although I do
12 not like to keep referring to Europe because there
13 may be other factors. However, they have been
14 even more heavily leaning on consumer taxes be-
15 cause they are presently up to 70 per cent of the
16 revenue in some countries. We have not found that
17 this is an insurmountable barrier on the demand.
18 We have found the incentive provided in lowering
19 the income tax, and we certainly have some comments
20 in Canada on this line.

21 Of course, if you have a productive in-
22 vestment in the investment sector, you do have a
23 multiplier in your National Gross Product and
24 therefore jobs. It is not necessarily the same
25 as to the expenditures.

26 MR. CONWAY: The exact figures, this
27 year the Federal Government are raising 47 per cent
28 from income and 40 per cent from consumption, and
29 our proposal would be that these should be adjusted
30 to 45 per cent from income and 43 per cent from

1 consumption.

2 THE CHAIRMAN: You think it will
3 sufficiently affect the economy?

4 MR. CONWAY: We cannot do it all in one
5 step. This adding three per cent to the sales
6 tax on consumer goods is going to affect prices,
7 quite naturally. We would not want to see a
8 sudden step of trying to pattern after some other
9 machinery that would have other disruptions.

10 On the other hand, when you look at
11 the income tax field, these percentages deal
12 with very large figures. If the total tax revenue
13 is approximately \$5 billion, a small change is
14 going to make a big difference in savings or
15 disposable funds, the disposable funds of the
16 individual.

17 You notice on the income tax change
18 we are allowing a maximum rate of 60 per cent
19 as an absolute maximum. There is some question
20 whether this should be 55 or 60, but we felt at
21 least down to 60. We have spread the rates right
22 through, and the result for the lower, middle
23 incomes by the tax of disposable income, will be
24 around \$2,000 a year. So although the shift in
25 percentages is small, in absolute dollars the
26 figures could be large.

27 Coming back to your first question by
28 Mr. Gibson, the basic philosophy we had in
29 approaching this was that first something must be
30 done. We do think private enterprise is not doing

1 this. We are not here to remove the freedom of
2 private enterprise to move in various directions.
3 We want to make it possible for private enterprise
4 to take action through a tax impetus leaving funds
5 at their disposal, both individuals and corpora-
6 tions. However, if the action is not taken in
7 the private sector, we feel it must be taken in
8 the public sector.

9 THE CHAIRMAN: Yes, but the question
10 we want elaborated is what should be done. As I
11 understand it, you think there should be a shift
12 from income taxes into sales tax. You may have
13 some more points, but so far that is the only one
14 I have been able to grasp.

15 MR. GOODMAN: We have the special de-
16 preciation allowance we propose which would be 50
17 per cent allowance in any year for class eight
18 investment items, which are essentially the ones
19 which would produce the goods in Canada, as an
20 additional investment incentive. We feel you have
21 got to look at what will be done with the govern-
22 ment dollars that will be invested in social
23 capital. They have not been withdrawn from the
24 economy and they have obviously a multiplier effect.
25 However, this is not all that we would have done
26 had we been able to approach the entire economy.

27 MR. CONWAY: On the social capital
28 question, in summary, we are increasing the con-
29 sumption taxes, lowering the income tax, and to
30 again net some revenue we are putting in a capital

1 gains tax the primary aim of which is equity but
2 also to produce substantial revenue. We have the
3 argument outlined in our brief. We do not feel
4 this is going to have undue effect on capital
5 investments. We have maintained our reasons. We
6 realize there is an open question here but we
7 have put forward our point of view. In the first
8 place we propose that in effect this revenue goes
9 with capital cost allowance which, if you increase
10 it, is going to diminish government revenue. So
11 specifically we are providing incentive to in-
12 dustry through the class eight machinery and
13 equipment, making it easier for them, we would
14 hope, to expand in this field of modernizing
15 equipment. We are leaving more disposable funds
16 in the hands of the individual who will be prone
17 to invest this after the first year, and there
18 is a chance revenue, as we pointed out in the
19 summary, which starts to accumulate to the govern-
20 ment. The 50 per cent investment realized is
21 one year in two. It continues to achieve your
22 savings the balance of future years. The company
23 that buys machinery today gets an extra benefit.

24 This revenue, we have stated, should be
25 invested by the government in broad term social
26 capital, particularly, we had in mind education,
27 technical research. I say that this has simply
28 been discussed in Canada over the course of the
29 last year more from the point of view of these are
30 things that should be done.

1 The question has been where will revenue
2 be provided to do this? What we have suggested
3 here, is where we think revenue can be provided
4 to do this.

5 So we are looking to the investment by
6 companies in machinery and expansion and by govern-
7 ment in education and training of workers, vocational
8 training and general education, to up-date our
9 technology on that side. Those are specific
10 proposals we have looked at here. We also men-
11 tion in our summary, although not in great de-
12 tail in the brief, specific measures that we would
13 do on the balance of payments side. We are most
14 concerned that possibly this matter will be one
15 of the major items your Commission will want to
16 look at. We have not spelled this out in detail.

17 COMMISSIONER GIBSON: Looking at the
18 tax proposals which you make and thinking of it
19 in terms of one of your main objectives, that is
20 to stimulate investment activity in the economy,
21 the increased investment allowance or depreciation
22 allowance (whatever you want to call it) this is
23 obviously clearly aimed in this direction. You
24 reduce the personal income tax, upper and middle
25 brackets particularly. This might have an effect
26 on investment, one would expect it would have an
27 effect on investment, although in the lower levels
28 it might affect consumption more than investment.

29 MR. CONWAY: Right.

30 COMMISSIONER GIBSON: You will put in a

1 capital gain tax. This, one would think, might
2 work to reduce investment and indeed offset the
3 changes you have made in the income tax. On the
4 other hand it is a little hard to add this up as
5 an investment stimulating programme. It has some
6 of the features but does not have them all. For
7 instance, why don't you reduce corporate income
8 tax in your plan which is something that people
9 that wanted to encourage investment have suggested?

10 MR. CONWAY: The corporations, I would
11 feel, get their funds for re-investment not only
12 from the cash flow which would be effected by
13 reducing corporation taxes, but also through de-
14 preciation allowance. We prefer to be specific
15 and pass the benefit to the corporations through
16 a depreciation allowance, not spread out a certain
17 amount of money which would be spread quite
18 thinly and may not be invested, may just go into
19 short term investments. We prefer to be specific
20 and say that this is the amount of money we have
21 produced in this one particular tax need and given
22 to the corporation. We felt the best way to apply
23 it was in the depreciation allowance rather than
24 spread it over corporate income tax.

25 We are not advocates or we do not think
26 corporation income taxes in Canada are too high.
27 We are, compared to the under-developed countries
28 of the world: Granted the laws of interpretation
29 of it differ, but the corporate taxes in the United
30 States are higher, in the United Kingdom are higher,

1 and in some of the European countries are higher
2 or as high.

3 We feel there should be an impetus to
4 corporations that want to expand, rather than
5 have a general reduction in taxes of the corpora-
6 tions. It is a matter of direction to apply this
7 amount of money.

8 MR. GOODMAN: Realizing that our class
9 eight investment would be open to people who im-
10 ported goods which might be produced here, we
11 wanted to offset this, so we have recommended
12 that these people - because our class eight in-
13 vestment is used to produce goods in Canada, to
14 produce exports - that they not be given continued
15 exemption from the sales tax. We have a very
16 specific sector of the economy which we wish to
17 stimulate.

18 MR. CONWAY: Therefore we apply all
19 the funds just to that particular sector rather
20 than spreading them out.

21 On the capital gains tax, I think one
22 has to keep in mind that when you look at capital
23 gains tax, as we have here, it is not capital gains
24 tax as such. Capital gains is a certain method of
25 taxation, but what you have to look at, it is going
26 to have an effect on investment incentive, how it
27 affects the individual, and the point that you are
28 going to strike it down to the point at which
29 naturally the person in the high tax bracket
30 making \$200,000 in capital gains, consuming \$50,000

1 of it, consumption expenditure and re-investing
2 \$150,000, to write in capital gains tax he is not
3 going to have as much money. This may not be
4 accepted, but on the other hand we do not agree
5 it is reasonable that this could not be adopted as
6 part of the tax policy of the country.

7 Therefore we acknowledge, we have taken
8 that money away from the investor, but we feel
9 that the funds that we have remaining, funds he
10 still has, and after all this is not a matter for
11 imperial study but after all there is not much
12 difference between Americans and Canadians in
13 this respect, once a person has a pattern of
14 investment it takes a lot to change the pattern
15 that they are used to.

16 Therefore, we go on and say in the
17 middle bracket people who have been taxed very
18 heavily on their salaries up to a maximum of 80
19 per cent, we have felt it is unfair that these
20 people bear such a large share of tax burden on
21 the individual. Therefore we have said we will
22 reduce their tax.

23 These people have got surplus money in
24 their hands. We hope we have put through a small
25 change in the tax system to increase the incentive
26 for them to invest. If this is not an incentive,
27 they will not invest naturally. We have a man that
28 has another \$2,000. If he consumes it we have
29 increased demand.

30 However, sales taxes have gone up. If

1 he consumes it we are going to get tax revenue
2 and the government will invest the money. How-
3 ever, if he chooses to invest, postpone his con-
4 sumption and not pay tax through consumption, then
5 we have some investment at that level. We have
6 got him into the pattern of investment and we
7 hope he would keep in this pattern. Granted, a
8 lot of what we are saying is balancing this
9 pattern and have been particularly put in to
10 achieve equity. On the other hand, the net effect
11 of his revenue, it can go into specific investment
12 incentives.

13 COMMISSIONER LEMAN: I would like to
14 ask you a few questions about the chapter dealing
15 with financial reserves. In paragraph 35 here you
16 make a statement that surprised me a bit. You
17 say that the result of the way this area of re-
18 serves has been administered, is that there is a
19 permanent reserve of more than 30 times average
20 annual losses over the last 25 years, and that
21 compared with the U.S. banks, you say they have
22 been allowed reserves against losses of three
23 times the average loss ratio of the previous 20
24 years. You seem to imply that the difference be-
25 tween the two systems is that the Canadian bank
26 reserve, annual reserve would be about ten times
27 as large as the American.

28 MR. CONWAY: I am sorry if that impression
29 is given. That is not our intention.

30 COMMISSIONER LEMAN: How do you think they

1 do compare in fact?

2 MR. CONWAY: It is very difficult to try
3 and compare banking systems in the United States
4 and Canada, in that we have a branch system in
5 Canada which covers the whole country and subject
6 to excellent government regulations and regulation
7 through the banks themselves for the branch offices.
8 In the United States they have a lot of local
9 banks that supposedly act in a degree under
10 federal regulation, but those regulations in many
11 cases have not been too effective.

12 As a result in the United States your
13 loss ratios are much higher. In fact in the
14 hearings they have held in the Banking Committee,
15 it is made out that a substantial portion of the
16 losses are from the results of fraud and defalca-
17 tion.

18 It is very difficult to try and take
19 a figure out of the air what a reserve should be
20 as a proportion to annual loss. It is very easy
21 to say: "Well, in the light of 25 years it is
22 so and so". Should a bank be allowed that per-
23 centage, only two times, three times, 30 times?
24 We are grasping to try and get some guide lines as
25 to what should be allowed.

26 We can look at private enterprise operating
27 companies, we can find that they have certain annual
28 losses and that they have reserves tend to be a
29 certain multiple. These generally range up to
30 four to five times their annual loss experience.

Nethercut & Young

Toronto, Ontario

- 1348 -

1 You have got to look at the range of the assets
2 involved, and there are so many problems.

3 When we approach the U.S., the banking
4 system in another country, we would not hope to
5 try and compare our own ratio, our own experience,
6 because the systems are so different.

1
2
3 The magic number they happen to choose -- that three
4 times loss ratio -- we did not just take that same
5 three times. We looked at private companies in the
6 finance field and saw what they had. Unfortunately,
7 the statistics are not available in Canada as to
8 the actual loss figures. It is impossible for us to
9 work out the amount outstanding and come out and
10 say that it should be four times or five times. What
11 we are saying is that thirty times is too high, and
12 we describe to you that in the United States they take
13 three times. There are implications in this, and it
14 was not necessarily derived from the accounting basis.
15 On the other hand, private companies which have gone
16 to the large finance companies in Canada -- it is
17 approximately three times. There is accounting
18 justification in this, in that they have justified
19 their actual loss experience. So, this was three
20 times, put in merely as an indication of a ratio and
21 not to say they are proportionately the same.

22 COMMISSIONER LEMAN: What made you arrive
23 at a recommendation of three times?

24 MR. CONWAY: We arrived at that on the
25 basis of what we have available as the loss ratio.
26 This is the only fixed thing we have available. Those
27 in the finance field, as it turned out over time --
28 their reserve just happened to equal about three or
29 four times -- under five times, in any case. There
30 is more risk in this type of loan, so we felt it
was not unfair to apply the same ratio to the banks.
We have also stated that if the actual estimated loss
was greater, then quite definitely it would have to
be allowed. Unfortunately, there is not the information

1
2
3 available to let us know what is the estimated loss
4 in proportion to their assets. They don't publish
5 what their actual bad debt is. There are no figures
6 to give us any indication of what this is as a
7 proportion of their annual loss. All we have done
8 is look at other companies in the finance field. We
9 would not want to argue if someone said it should
10 be four or two times, but we think that thirty times
11 or even ten times is quite excessive. If we approach
12 five, or under five, it is more difficult because
the statistics are not available.

13 COMMISSIONER LEMAN: You make a statement
14 here about the formula used in the United States, which
15 I don't think is quite correct.

16 MR. GOODMAN: There is an amendment to it:
17 It is the worst 20 years since 1927.

18 MR. CONWAY: Since 1927 to 1947 happened
19 to be the worst, they all use it.

20 COMMISSIONER LEMAN: So obviously by going
21 back to 1927 and picking the worst 20 years you get
22 a different result than by taking the last 25 years,
say, especially when you are in 1962.

23 MR. CONWAY: That is right. On the other
24 hand, we don't necessarily feel that the period of
25 time concerned -- we have not made any statement as
26 to how adequate we feel the 20 years is. You can
27 look back to the banking system in Canada and find
28 out what happened there, and you will find during the
29 worst period of the depression the banks in the net
30 added to their inner reserves rather reducing them.
You can look at private business and find out under
current economic conditions what this amounts to.

1
2
3 As I say, then we stopped dead: We have got details
4 in the United States, and taking the worst 20 years
5 naturally gives them a higher figure, having a higher
6 defaultation in this period.

7 MR. GOODMAN: The interesting point about
8 the American banks -- we are not granting a complete
9 comparison -- is that out of 13,600 banks, 6,504 --
10 almost half -- have such a small annual average loss
11 that they are not able to make use of this provision,
12 and they don't have any bad debt.

13 COMMISSIONER LEMAN: It is a little more
14 complicated than that: There is the general reserve
15 and specific reserves, for specific accounts.

16 MR. GOODMAN: We are only talking about
17 the tax-free inner reserve.

18 COMMISSIONER LEMAN: Yes, but they are
19 affected by the capitalization ---

20 MR. CONWAY: Are you talking about the
21 Canadian system now?

22 COMMISSIONER LEMAN: Yes.

23 MR. CONWAY: The Canadian allowances set
24 a maximum rate; that is the maximum for both the
25 specific and the general.

26 COMMISSIONER LEMAN: That is right.

27 MR. CONWAY: Therefore, when we talk about
28 a certain maximum here it does not make any difference
29 whether we apply it to specific or general, because
30 if you talk of the maximum it applies to the total
of the two.

COMMISSIONER LEMAN: Not in the States.

MR. GOODMAN: We are trying to compare the
two systems.

1
2
3 MR. CONWAY: We were just bringing up
4 here the fact that in the United States, taking some-
5 thing in an actual loss, the amount they came to was
6 three times.

7 COMMISSIONER BROWN: Plus specific reserves?

8 COMMISSIONER MACKINTOSH: Specific reserves
9 are outside that?

10 MR. CONWAY: The specific reserves in the
11 United States, when you get down to the annual loss
12 ratio between banks, this is hazy in their interpretation.

13 MR. GOODMAN: You are right: We think we
14 haven't been able to be too clear on this. This is
15 the besides the specific reserves, and these 6,500
16 banks had specific reserves besides.

17 COMMISSIONER LEMAN: I don't think we want
18 to get into a long calculation here orally to show
19 this, but I think your brief leaves the impression
20 that the inner reserves in Canada are much higher
21 by comparison with the Americans than they really
22 are.

23 MR. CONWAY: No, we are not trying to
24 compare the reserves in Canada with the United States.
25 The two systems are not parallel. We have tried to
26 take one item in the United States and point out that
27 Canada has a straight economic system. The Canadian
28 banking system is relatively unique and we would prefer
29 to compare the banking system in Canada with the
30 finance ratios in Canada -- and general business
companies. We specifically have not gone into more
detail in the United States system because it is so
impossible to compare with their system.

1
2
3 THE CHAIRMAN: On the other hand, you have,
4 to anybody reading the sentence, done exactly that.

5 MR. CONWAY: Right. We have picked one ratio
6 that they have used. We have not tried to say total
7 reserves.

8 THE CHAIRMAN: But the impression left is
9 that there is a very wide difference.

10 MR. CONWAY: What we are comparing is the
11 three with the thirty. You feel the wide difference
12 in the United States is, in effect ---

13 THE CHAIRMAN: I don't know, but reading
14 that I thought it is a very substantial difference
15 and that that was the point you were making.

16 MR. CONWAY: That is right, there is a
17 substantial difference. The point we are making is
18 between the relative reserves of the two banking
19 systems.

20 MR. GOODMAN: You have to look at it in
21 the entire section where we have dealt with the reserves.
22 We are looking at the Canadian tax-free inner reserves
23 and saying, what are they being used for, what are they
24 needed for, and what is a proper amount to grant.
25 There is such sketchy information available we have to
26 grasp what comparisons we can. We took private
27 business and said that if the banks want to go down
28 count by count and check all bad debts, or right. We
29 looked at the others to see what was a reasonable
30 ratio. We looked at the Americans what number they
are using. We did not intend to make any comment
about the size of Canadian tax-free innner reserves
as compared to the American.

1
2
3 COMMISSIONER LEMAN: I don't want to labour
4 this any more than it has to be laboured, but I want
5 to point out ---

6 MR. GOODMAN: We are sorry about the
7 implication.

8 MR. CONWAY: There may be misinterpretation
9 here, but we would still want to later discuss, if
10 you felt it necessary, this one item of the three
11 times we are using, which is one specific example of
12 many examples. We do not agree because there is
13 some question of a low level that thirty is reasonable.
14 We have mentioned specific reserves ---

15 COMMISSIONER LEMAN: Well, this goes on
16 the record and I just wanted to put that on the record.

17 MR. CONWAY: I am sorry we gave you that
18 impression. On the matter of information, we have
19 available the Bank of Canada figures and we have
20 used those and there is a number of ways of using
21 the Bank of Canada figures. There are varying
22 degrees of information in the Bank of Canada figures
23 shortly after 1954 and recently, which, by cross-checking
24 the two sets of figures you can come up with specific
25 figures. We have got releases by the Inspector
26 General of Banks which details how the maximum is
27 computed. It is not public information, but it is
28 request and it is possible to get this percentage and
29 give specific answers. We are able to go down and
30 say that this is an estimate of the amount of permitted
reserves at the present time. Here again, the
information is not absolute because we don't have the
foreign assets of the banks. We only have what the
American banks have issued in that regard. We have

1
2
3 information here on the States, and we can see what
4 has gone in and out. We have tried to put these in
5 and see how it fits, and then we have a tie-in with
6 the guide lines as to what seems excessive and what
7 is reasonable. We are mainly trying to work down,
8 and it would appear to us from what information is
9 available that thirty is excessive. We certainly
10 would not be able to argue with the evidence available
11 that three is the magic number that can be applied.

12 COMMISSIONER LEMAN: With all this reasoning
13 and information you had, or thought you had, you came
14 up with your opinion that three times average loss
15 ratio for 25 years would be the right figure?

16 MR. CONWAY: Or the actual, whichever is
17 the larger.

18 COMMISSIONER LEMAN: And that leads you
19 to figuring that you would like to get back \$100
20 million from the banks?

21 MR. CONWAY: \$150 million.

22 COMMISSIONER LEMAN: \$ 150 million, yes.
23 I would like to ask you two questions in relation to
24 this conclusion, which is a conclusion based on an
25 opinion. The first question is, suppose that the inner
26 reserve or the total reserves of the banks, based
27 on your opinion, would, in their opinion, be insufficient:
28 What do you think the banks would do?

29 MR. CONWAY: They could carry on providing
30 in the method that is sufficient to protect the
deposits of the shareholders. All we are saying is
that we do not feel they should get a tax advantage
not available to other portions of the business. The
banks have to provide what they feel are adequate

1
2
3 reserves. The question for government is, are they
4 going to tax all segments of industry in the same
5 manner. Can some segments fall outside that and
6 get certain tax benefits, and we are not questioning
7 this, but we have picked out one particular ---

8 THE CHAIRMAN: You are not only questioning
9 it but you make some very bald statements about it.

10 MR. CONWAY: This is correct.

11 THE CHAIRMAN: And then suggest that you have
12 not got enough information.

13 MR. CONWAY: We haven't got enough information
14 to tie down whether these inner reserves, say, are
15 \$320 million or \$380 million. We know within a range
16 -- again, we can only take what is available -- but
17 we are able to determine what would appear to be the
18 maximum. We have the full information on this other
19 than the foreign assets. Then we have to make the
20 assumption as to what amount the banks' reserves are
21 in proportion to this. We can only take what is in
22 the annual reports, transferred in and out of inner
23 reserves. But if a bank is transferring money in and
24 out of tax paid reserves, or from inner reserves to
25 accounts and paying taxes on it, there is every likeli-
26 hood their inner reserves are at a maximum. Banks
27 may be paying more taxes than they have to. This
28 is a possibility we are unable to ensure looking at
29 the material available. At the 1954 one of the banks
30 stated they were at the permitted maximum, so this
gives us the proportion of the permitted maximum of
reserves at the end of 1954 that we know. We also
know the transfers in and out of these inner reserves
since 1954, because this is public information from the

Nethercut & Young

Toronto, Ontario

- 1357 -

1
2
3 'Bank of Canada. Where we have sketchy information,
4 is where we tried to do two or three sketchy approached
5 and get all our approaches coming to the same figure.
6 We lack one bit of information, but we come to the
7 same approach. Then, with the top added amount that
8 is in excess of \$300 million, we found it was reasonable
9 to make the statement.
10
11
12
13
14
15
16
17

21
22
23
24
25
26
27
28
29
30

1
2
3 We would be quite willing to go into
4 detail but people through the Bank of Canada reports
5 are quite aware of what is there. It would be quite
6 proper for someone to try and argue that it should
7 be something under \$100 million. We feel with the
8 information available it would be most difficult
9 to argue it would be under \$150 million but we
10 included that under that narrow realm of \$140 million
11 to \$190 million. We could not tell you the figure,
12 we just do not have it available.

13 COMMISSIONER LEMAN: Anyway, as a result
14 of your exercise you have ended up with what you
15 think would be a windfall income for the federal
16 government of \$150 million?

17 MR. CONWAY: Not a windfall so much as a
18 means of securing a windfall for the federal finances.

19 COMMISSIONER LEMAN: And then you suggest
20 you would give the Finance 10 years in which to
21 amortize this or pay it off and from there you jump
22 to two purposes you would like to use this for --
23 mortgages and small business loans. Did you go from
24 the windfall into the two purposes or did you start
25 with the purposes and look for the windfall?

26 MR. CONWAY: We were not sure at the time
27 we prepared the brief just exactly what the scope
28 of this Commission was going to be. The brief had
29 to be filed prior to the time the Commission held
30 any hearings. The material we had available when we
asked the Commission secretary was that we could make
all the submissions we wanted to, naturally, but it
would be up to the Commission to determine whether
they wanted to discuss particular points. We were

1
2
3 most concerned that these were two areas that should
4 receive discussion and to try and tie them in we
5 brought them with these sources of revenue. Quite
6 definitely we feel they stand alone. On the other
7 hand we feel there is a connection in that we would
8 be looking to a great extent to the banking system
9 to develop this money from small savings.

10 We are trying to show here, if the argument
11 is made which could be made if we are going to take
12 a sizeable amount from the banks how are they going
13 to perform the function -- we are trying to say
14 that it could be said that the money would be used
15 for particular purposes and we are going to maintain
16 the banks' position and help the banks in their loaning
17 activity. If we came down to the one that was cut
18 off, i.e. resources, we would not say this was
19 desirable.

20 THE CHAIRMAN: Well, if the banks have
21 received more money than they should have received
22 and set aside as inner resources and that \$150 million
23 should be released from these resources why should
24 it be applied to any particular project? Why should
25 not it go into the general government revenues?

26 MR. GOODMAN: It could go into it quite
27 easily. We tied this together for convenience sake.
28 But if you decide that mortgages and small loans ---

29 THE CHAIRMAN: Well, if you were right
30 in your proposition that means that the general
revenue of the country would definitely pay the
\$150 million?

MR. GOODMAN: That is correct.

MR. CONWAY: And it so happens we have a

1
2
3 particular programme in mind that would cost the
4 general revenue \$150 million.

5 THE CHAIRMAN: And the business of the
6 mortgages is a separate proposition entirely that
7 would come out of general revenue?

8 MR. CONWAY: That is correct.

9 THE CHAIRMAN: But the money never could be
10 applied on money for mortgages?

11 MR. GOODMAN: But we did not want to propose
12 anything that would call for deficit financing on
13 this. We could say this is another point that we
14 do not confuse with a deficit programme.

15 MR. CONWAY: We are not raising the issue
16 of deficit financing.

17 COMMISSIONER GIBSON: But if they are worth
18 anything they are worth doing?

19 MR. CONWAY: That is correct.

20 COMMISSIONER GIBSON: What sort of study
21 have you made of the need for this particular amount
22 in this area? As you know there has been a small
23 business loan arrangement set up six or eight months
24 ago, maybe ten months ago. This is in operation.
25 Now, what is the matter with that? You have mentioned
26 that you do not think this goes far enough?

27 MR. CONWAY: That is right.

28 COMMISSIONER GIBSON: Are you satisfied
29 that there is an additional real need to be filled
30 here? Have you studied the results of the loans
that have been made under this recent Act?

MR. CONWAY: From what information is
available we have. Personally we feel that two of
the limitations are, first, the definition of a small

1
2
3 loan and, secondly, the amount of the loan and if
4 these loans are to be arranged by the government they
5 would have to put up some funds to guarantee the
6 banks against potential loss but we feel that a
7 good proportion of this money primarily is going to
8 come within the limitations so there is a great need
9 for increasing the limitations so that larger loans
10 could be made. That is from the side of providing
11 the fund. Quite naturally if the economy is not
12 growing, if there is not any opportunity for
13 profitable investment the firms are not going to
14 borrow the money. Just having the money there does
15 not mean that people are going to run in and borrow
16 it.

17 COMMISSIONER GIBSON: You are proposing
18 that here we have an economic programme but we do
19 not have surplus resources just waiting around to be
20 used by anyone. If this country wants to try a
21 big addition to an economic programme or a big
22 change we have got to be satisfied this is one of
23 the best things you can do in this set of circumstances.
24 I do not think you have fully explained why this is
25 so. We have looked at the small business loans
26 arrangement. It seems to be working well but a
27 relatively small part of the total monies have been
28 taken up as yet.

29 MR. CONWAY: That is correct.

30 COMMISSIONER GIBSON: It seems to me it
is up to you if you are making a proposition of a
general nature which you are interested in and would
like us to consider, we would like to know a little
more about the evidence to suggest that it is a good

1
2
3 thing?

4 MR. CONWAY: As mentioned earlier we cannot
5 go into all the details here to explain what we have
6 done. As mentioned, we feel particularly within
7 limits that there was some opportunity there. In view
8 of what use has been made of the programme so far
9 it would be hard to say that the banks had approached
10 this programme with reluctance. On the other hand,
11 it is possibly not so hard to say that this programme
12 has not been emphasized or publicized or pushed by
13 enough information as greatly as it may have been
14 possibly.

15 COMMISSIONER GIBSON: Well, that is a sort
16 of an innuendo with nothing to back that up.

17 MR. CONWAY: We have not conducted a detailed
18 survey.

19 COMMISSIONER GIBSON: I see no evidence
20 of that.

21 MR. GOODMAN: The main evidence we were
22 going on was not based on this most recent act
23 because at the time we presented this we did not
24 have any time to study it as we would have liked to.
25 We had the figures on loans between October, 1956
26 and October, 1957 which covered the shift from
27 easy money to tight money and firms with more than
28 \$100 million in assets had 60 per cent more of a
29 complete shift and in between the firms fared in
30 conformity to their size.

THE CHAIRMAN: What does that prove?

MR. CONWAY: If we have a banking system
as it stands today and the banking system is a private
enterprise that is operated not only for the public

1
2
3 economy but the private profit for the shareholders
4 quite naturally we feel that as between the maximum
5 interest rate and the lowest interest rate it is quite
6 right that a bank manager faced with two or even ten
7 requests, one for the delivery of \$1 million which
8 is going to produce $5\frac{1}{2}$ per cent revenue and offsetting
9 this ten requests for loans of \$100,000 each, he
10 has in mind his responsibility of providing credit
11 to improve the economy but nevertheless there is the
12 side issue that in respect to the larger loan he
13 will have virtually the same revenue and he is going
14 to have less administrative cost.

15 COMMISSIONER GIBSON: That is not the way
16 the system works. Banks have branches throughout
17 the country and the branches are each judged by the
18 way they can make a profit. It is not as simple
19 as you suggest.

20 MR. CONWAY: I am sorry if I suggested this
21 was simple. There are a number of things to be
22 considered as to the way the loans are made. We have
23 not made any recommendation here on a maximum interest
24 rate. We feel 6 per cent may not be an excessive
25 rate but we realize if the government wants the banks
26 to make more loans it must step in and guarantee the
27 banks to protect them against the risk. So we say
28 that in spite of anything that has gone on to date
29 we feel it is important, this providing of the banks
30 with the insurance guarantee that they can take this
risk. We must have the publicity as an attraction
to get the firms knowing this is available and then
it is a matter of having a growth in the economy
or a demand in the economy so the firms want to borrow

1
2
3 the money. It is unfortunate in our system in
4 Canada that many small firms feel they cannot go
5 to the banks and there have been surpluses of this
6 money recently.

7 COMMISSIONER GIBSON: For what kind of
8 money?

9 COMMISSIONER BROWN: I think what you are
10 getting at is a loan requires both a lender and a
11 borrower. What evidence have you that there are
12 lenders who won't be satisfied?

13 MR. CONWAY: One might have would-be
14 borrowers who are borrowing from some other sources.
15 You have borrowers who are borrowing from sources
16 at higher interest rates; you have borrowers who
17 are taking loans from finance companies, sometimes
18 borrowing at 8, 9, 10, 11 per cent who are borrowing
19 at higher rates of interest than the bank interest
20 rate. Now, these particular people have looked at
21 a particular investment and decided they will go into
22 this and it is worth paying 10 per cent or 11 per cent
23 to go into it. If the borrower decides he can spend
24 so much on investment and make so much profit at 10
25 per cent, we do not think that is an unfair presumption
26 to assume that he could borrow at 6 per cent or 5½
27 per cent under the Small Business Loans Act.

28 COMMISSIONER BROWN: What is the size of
29 all this?

30 MR. CONWAY: We are saying here it is
impossible to know the size. However, you just have
to have the means available and within the economy
to get the demand. It is absolutely impossible to
survey the economy and say that \$2 million or \$2 billion

1
2
3 could be borrowed and spent on the small business
4 loans but where the investor decides -- the person
5 borrowing the money and buying equipment knows what it
6 is going to cost and he is quite willing to accept
7 a lower yield and therefore will expand more rapidly
8 into other areas.

9 Now, with the banks at the present time
10 these people cannot go to the banks to a great extent
11 because they can only borrow on their receivables
12 and they are borrowing then for machinery and that
13 type of thing and this is why the Small Loans Act
14 came in -- to borrow at a low interest rate from a
15 man close to him that he has already borrowed from
16 on his receivables.

17 We understand that the limits at the moment
18 are for an individual to borrow up to \$25,000 within
19 the definition of "small business". We say if you
20 widen this you will have more people who want a
21 loan. Therefore, you have the government guarantee
22 the banks against loss and that is why we are putting
23 this in.

24 I would question even that the banks with
25 the resources they have available could estimate the
26 exact demand. On the other hand, you could compare
27 this with machinery and everything going out the
28 other side as well. We hope all this will get the
29 people looking and seeing if they can invest more.

30 COMMISSIONER LEMAN: How much judgment should
the bank exercise in granting this type of loan if
they are automatically guaranteed by the Federal
Government?

MR. CORWAY: My understanding is they are not

1
2
3 guaranteed under the present Act. There is a
4 certain limit on the amount. The insurance fund has
5 a certain limit.

6 MR. GOODMAN: 80 per cent for equipment and
7 90 per cent for premises.

8 THE CHAIRMAN: You suggest that that should
9 be extended?

10 MR. CONWAY: Well, the present Act sets
11 it at \$30 million to provide against losses. Once
12 that is gone it is the bank's loss.

13 THE CHAIRMAN: But your suggestion is the
14 government should guarantee ?

15 MR. CONWAY: No, we state they should
16 increase the insurance fund from \$30 million to
17 \$130 million.

18 COMMISSIONER GIBSON: So on the same basis
19 that is being done now but the limit is raised?

20 MR. CONWAY: That is correct.

21 COMMISSIONER GIBSON: You are not saying
22 that your amount has any particular validity; you
23 would like to see some stimulus given in this
24 area.

25 COMMISSIONER BROWN: It should be greater.

26 MR. CONWAY: Perhaps that could be governed
27 by the demand, but take it to \$100 million. We
28 do not feel the \$100 million is excessive but
29 there might be much demand.

30 COMMISSIONER BROWN: Could the I.D.B.
not take care of that?

MR. CONWAY: The I.D.B. is helping to a
certain extent in that fashion although they have
gone into much larger loans. Many of these people

1
2
3 are also borrowing from the banks and it is just
4 a matter of increasing their growth. Here again
5 by providing the means to borrow at less interest
6 because we say if you do not provide the means and
7 publicize the means how can you expect the people
8 to look at the possibilities and opportunities?
9 That is our proposition but we cannot just drop off
the means.

10 COMMISSIONER BROWN: I think the I.D.B.
11 averages somewhere between \$50,000 and \$60,000.

12 MR. CONWAY: That is their average. However,
13 they have a considerable amount of loans in higher
14 figures, over \$100,000, \$200,000 and larger ones.

15 COMMISSIONER BROWN: But they must have
a lot of small ones.

16 MR. CONWAY: That is right. Of course,
17 many of these loans were brought out before the
18 banks got into this field. So you have two outlets
19 providing the same thing. That is twice as good a
20 reason why the people should know the outlet is
21 there and make use of it. We do not see any harm
in competition from I.D.B.

22 MR. GOODMAN: Did you want us to go into
23 the reasons for the mortgages as well?

24 COMMISSIONER MACKINTOSH: I have some interest
25 in that. This would at some juncture be an improvement
26 in the capital market. How does it fit in with the
27 growth and employment objectives limited as it is?

28 MR. GOODMAN: We find sharp cyclical swings
29 in housing. Farm growth, we cite what happened in
30 1959 and 1960, the first and mid-year surveys in
investment in the 1960 projects, a sharp increase

1
2
3 over 1959. It turned out in the end of the year
4 totals we found a sharp drop but the reason was almost
5 solely due to housing expenditure.

6 We calculate that one of the reasons for this
7 sharp cyclical swing is that there is a sharp
8 division between new houses under the N.H.A. and old
9 houses which certainly do not have any guarantee
10 to them. We do not calculate that the buyer -- you
11 have pressure coming for new houses under the N.H.A.
12 from people who may be selling their old houses. If
13 they cannot get a buyer for their old house they
14 cannot go into their new house. What we are proposing
15 is that some form of insured mortgages be available
16 for used houses. The facts we found concerning a
17 lot of this came from a book which is just about to
18 be published which tries to look into the secondary
19 mortgage market and used house market with a lot
20 of imperial surveys which are generally interview
21 types. We find that people, when they were not able
22 to obtain a reasonable rate, given the economic
23 conditions, that they rented rather than purchased
24 which permanently postponed their borrowing and rather
25 than have these higher interest rates we would suggest
26 using what is a limitation in a small amount of money
27 and what is a good administrative programme now that
28 these funds be created to balance new house mortgages
29 by insuring used house mortgages or by providing used
30 house mortgages. Once you have this smoothed out
so you have a more integrated mortgage market -- and
I gather there would be more steps required than
this -- if you can smooth the wrinkles out, the
sharp wrinkles, you automatically have more certainty

1
2
3 when it comes to investment for the future years.

4 I think we can estimate figures, looking
5 at the former years, guided by what the population
6 was which this embraces and what the investment will
7 be, what the various types of spending will be.
8 Presumably this is one of the reasons the government
9 publishes this survey. I think then the people will
10 be quite willing to provide investment which I feel
11 is an essential part of growth.

12 COMMISSIONER MACKINTOSH: The distinction
13 which you draw between this and growth is that you
14 feel the large specific factor at the time of the
15 building of new houses is the inability to sell old
16 houses?

17 MR. CONWAY: The first reaction could very
18 well be that if you make the market available for
19 used houses the first instant reaction would be someone
20 looking at a new house and possibly they could get
21 by at a lower cost on an old house and the result is
22 that the new house market would have some demand
23 transferred to the used house market. On the other
24 hand, we feel as well there is a demand for housing
25 as opposed to apartments and if you prepare the way
26 for people to go into old houses in the end your
27 demand for new houses would ultimately increase or
28 certainly smooth out.

29 Again, we are getting at the equity of the
30 situation. We have made our proposals but only on
the growth. After all, we have to look at the present
time. There has been inequitable development in the
system over the years. There is a major inequity
now in the problem people find themselves in with

Nethercut & Young

Toronto, Ontario

- 1370 -

1
2
3 high cost second mortgages, the difficulty of getting
4 financing for housing. So even if there was not any
5 expansion we feel the proposal would still stand
6 on its merits on the basis of equity.

1 COMMISSIONER MACINTOSH: I think it has
2 merit as a suggestion for improving the mortgage
3 market, and it has merit as a means of improving
4 mobility of people who are often held up by
5 inability to sell a used house, and people newly
6 coming to an employment and finding difficulty in
7 acquiring a house because they have not the much
8 larger cash payment that is likely to be demanded
9 on a used house. You put it in a smooth pattern.

10 MR. CONWAY: Well, on the basis that
11 if the proportion of the population at the present
12 time living in apartments, if the proportion
13 shifts so you have more living in houses because
14 they have the means to move into houses, this
15 requires greater expenditure on the part of
16 population in going into a larger type of re-
17 sidence, and this greater expenditure in itself
18 would be a stimulus, yes.

19 COMMISSIONER MACKINTOSH: Yes, on the
20 assumption that you will have an apartment of a
21 certain type and acquire a house of a certain type,
22 but beyond that I could not say.

23 MR. CONWAY: That is correct. Even if
24 a person is spending the same amount of money in
25 a house, the \$100 a month breakdown between in-
26 terest and principal, that enables him to get a
27 certain quality house, and with that same \$100 if
28 he can get into a larger sized house there is
29 greater expenditure on construction.

30 COMMISSIONER MACKINTOSH: Maybe a little

1 tenuous.

2 MR. GOODMAN: We feel the other arguments
3 have more merit.

4 COMMISSIONER BROWN: I am wondering about
5 another question that you do not deal with specific-
6 ally in your brief, and that is you do not mention
7 the possible problems of capital flow and inflow
8 in the international sector. Can you give us your
9 opinions on the floating exchange rate or fixed
10 exchange rate and how you think one or the other
11 would produce the movement you hope for?

12 MR. GOODMAN: Well, on international
13 monetary funds the experts who come from Harvard,
14 and they happen to be our teachers, are inclined
15 to say, "You nasty Canadians, you are beggaring
16 your neighbours with this", but our own thinking
17 on this is we have to go upon a fixed exchange
18 rate, that this is first of all fair and inter-
19 national. We ask for a certain amount of time to
20 iron out a domestic economy. Whether the Govern-
21 ment has just been smoothing out day to day affairs
22 or whether it could not have been manipulating a
23 little bit, is a matter every international investor
24 is going to decide on his own. To our mind, once
25 people begin to think you are manipulating the
26 exchange rate, whether you are doing it or not but
27 if people think you are, you run the terrible risk
28 of this crisis of confidence, as we try to emphasize,
29 because this has been one of the reasons we feel
30 this problem of the balance of payments is one that

1 we will be facing very shortly.

2 Now, if we peg our exchange rate at a
3 proper international figure, one that accurately
4 reflects the buying power of the Canadian economy,
5 it is neither over-valued nor under-valued with
6 respect to other countries, we provide an economically
7 most efficient method of making an economic choice
8 both by foreign investors and ^{by} domestic investors.

9 In sum and substance, we came to the
10 conclusion that the exchange rate should be fixed
11 and will have to be fixed.

12 COMMISSIONER BROWN: Leaving aside all
13 the background that you might produce and the
14 rest of it, what do you think from the purely
15 Canadian point of view?

16 MR. CONWAY: The thing that concerned us
17 from the Canadian point of view is that at the pre-
18 sent time we have accomplished an excellent ob-
19 jective in our export-import balance in bringing
20 the rate down, but the trends of the past
21 particularly the last five or six years of foreign
22 investment in Canada, the increase in payment of
23 dividends and interest and shares, money flows into
24 the country, have very nicely worked out to our
25 advantage in that we have not had undue pressure on
26 Canada, that the short term money flows have come
27 along just at the very time that we have needed by
28 increased payment of dividends. We are most con-
29 cerned that this convenient balance may not con-
30 tinue.

1 The American government - and we cannot
2 ignore the American government unfortunately because
3 it has such a great effect - has announced the in-
4 tention in a particular area of what they intend to
5 do, having gone to the extent that both the President
6 and Mr. Dillon have specifically introduced a measure
7 they say is aimed only at Canada. In other words,
8 they are claiming all the calls of the short term
9 money into the country, and are entering in two
10 measures, have entered in and are really proposing
11 changes which we understand have every likelihood
12 of getting passed, if nothing else gets passed, and
13 these measures will have terrific effect on the
14 Canadian economy, in that they are going to go
15 for a figure upon a balance of payments.

16 Now, if we have this risk threatening
17 us, then the question is how we are going to pre-
18 pare for it. We feel there are two things. One,
19 we now have a fluctuating exchange rate being
20 supported with our exchange fund which has come
21 down from over \$2 billion to about \$1.7 billion.
22 This is a lower limit. That exchange fund, to
23 support a fluctuating rate, if it takes a sudden
24 drop, even a more sudden drop down towards more to
25 the \$1 billion, is going to create, could very
26 well create a lack of confidence, create lack of
27 confidence in the Canadian dollar and the Canadian
28 investment picture.

29 So what we are now about in the floating
30 exchange rate, which has been maintained at this

1 point, if there is a drastic outflow and there
2 are problems maintaining that, our reserves go
3 down and we are faced with lack of confidence.
4 It may be better to settle the problem of the ex-
5 change rate, whether floating or fixed, before we
6 have the situation forced upon us.

7 Second sight in our specific recommenda-
8 tions of this kind, are that if we know we are
9 going to be faced with this we just cannot expect
10 this present rate to continue that we have had to
11 date. If we know short term funds are not going
12 to at least increase as at the present time, it
13 can be said that short term funds in which Canadian
14 interest rates are mentioned, we are not going to
15 get more short term money and we are liable to
16 lose what we have.

17 Long term investments we have already
18 discussed. Interest and dividends have been falling
19 in the last couple of years, about three and a half
20 per cent to the investment in Canada. This is a
21 very low yield to the person who is investing in
22 the country. Once he decides to pull out more of
23 his earnings the figures can increase substantially.
24 Last year we went up \$100 million, 1960-61. So we
25 are looking at our interest and dividends increasing,
26 our direct long term investments being reduced, and
27 our short term money which has balanced the books
28 has been cut off by American direct legislation,
29 and we are back to: What do we do?

30 We think first of the exchange rate.

1 Second, there should be some endeavour on the part
2 of Canadian authorities to have the Americans
3 postpone some of their measures. After all, we are
4 not exactly causing the American balance of pay-
5 ments problem. In fact we are contributing to
6 their stabilization for the balance of payments.
7 We see very little reason why there should be
8 direct American government action when we have to
9 solve our own problem. We feel pressure should be
10 put to postpone this particular item to get our
11 houses better organized.

12 Thirdly, we felt that the government as
13 well as naturally trying to get the economy going
14 so that the investor wants to leave his money here,
15 is going to have to be prepared to get into the
16 long term money market to balance short term
17 outflows of capital. The American market is
18 discouraged from looking to our side and is
19 encouraged again to look south of the border.
20 We feel this is an area we
21 We should be following in the United States rather
22 than forcing the exchange rate figures and the
23 attendant problems to our local economy, and
24 that they should be quite prepared to move their
25 capital into this field, so that we do not have
26 a big reduction which creates a confidence crisis.
27 We have put this on a very, very high priority.

28 THE CHAIRMAN: Any further questions?

29 That's all, very much, gentlemen.

30 MR. CONWAY: Thank you very much,

for listening to us.

1 --- Addition to summary read by Mr. Goodman.

2 This is not to say that we disapprove
3 of deficit financing under appropriate circum-
4 stances.

5 But our submission, while perhaps far-
6 ranging, is still far from the entire programme
7 we would prescribe to deal with the woes of the
8 economy at this time.

9 Since our submission is limited, however,
10 and since deficit financing is a separate issue,
11 we suggest a programme with balanced revenues
12 and expenditures.

13 Similarly the adjustments we suggest
14 for the tax structure are only some of many
15 proposals we would make were this Royal Commission
16 attempting a comprehensive review of taxation.

17 We feel our proposals would be a sound
18 part of any programme to cure the ailing economy,
19 but we emphasize that many more measures are
20 required.

21 Urgency is a basic tenet of this submission.
22 We are concerned with the Canadian economy, which,
23 in the final analysis, must be the prime concern
24 of this Royal Commission, and we are particularly
25 concerned with the tone of recent official assess-
26 ments of the economy.

27 This is a tone of complacency, a tone
28 of satisfaction that we do not believe is substan-
29 tiated by the actual performance of the economy.

30 It is tragic, for instance, to accept as

1 fact that to have stable prices in Canada means
2 600,000 people unemployed.

3 It is irresponsible to profess satis-
4 faction with recent growth when in effect it has
5 been stagnation.

6 It is ludicrous to point with pride
7 at our balance of payments when legislative action
8 in other countries threatens to cut off the
9 foreign investment which in effect finances our
10 standard of living. Should this investment be
11 redirected, we would have to take drastic steps
12 to balance our international accounts. This in
13 turn would be a stern constraint against measures
14 that would be necessary to revitalize the domestic
15 economy.

16 We have had exceptionally good fortune
17 in our balance of payments. Higher interest rates
18 combined with tax advantages resulted in a
19 sharp increase of U.S. funds to Canada. For
20 example, by May, 1961, \$3,100 million was deposited
21 with Canadian banks in New York, of which \$700
22 million had been brought to Canada.

23 Last January, U.S. banks were allowed to
24 increase to competitive interest rates, This is
25 stopping the flow to Canada and may cause a reverse
26 flow.

27 By the end of this year or the beginning
28 of next, a revision of U.S. tax law is expected which
29 will adversely affect the attraction of investing in
30 Canada.

1 These changes are likely to be:

2 1. A change in the foreign tax credit
3 provisions to remove the incentive to U.S. parent
4 companies to move short-term funds into Canada.

5 2. A proposal to include foreign real
6 estate holdings in the valuation of U.S. estates
7 for tax purposes. At present foreign real estate
8 holdings are not taxed, and considerable U.S.
9 funds have been invested in Canadian real estate.

10 3. A proposal to nullify the tax ad-
11 vantage of investing in Canadian non-resident
12 owned investment corporations. There are at
13 least 10 such corporations with about \$300 million
14 invested in Canada.

15 Meantime there has been a steady upwards
16 trend in net dividends and interest out of Canada.
17 These rose from \$391 million in 1956 to \$491
18 million in 1960 and then jumped sharply to \$575
19 million in 1961. This represents a yield of only
20 three and a half per cent on more than \$23,000 million
21 of foreign investment in Canada. The yield is less
22 for equities since bond rates have been higher.

23 It would be folly to believe that U.S.
24 investors will not soon withdraw a higher yield.
25 The tax advantages will be gone. Our economy is
26 in danger of losing its attraction compared to
27 such dynamic areas as western Europe. President
28 Kennedy is determined to use every weapon to balance
29 U.S. international payments, and the record of the
30 past week indicates the forcefulness of the

1 President's will.

2 We are now getting what amounts to a
3 free ride -- covering outflow with foreign in-
4 vestment -- but we should not be decided by a
5 current balance.

6 We must be prepared for the inevitable
7 loss of this short-term crutch. If we are not
8 able to meet an outflow of dividends and interest,
9 a confidence crisis will result and there will be
10 an outpouring of principal.

11 We believe these problems need immediate
12 consideration and action. This Royal Commission
13 should provide the guidelines for government
14 action and leadership.

15 In the more limited areas touched on in
16 detail by this submission, we begin by examining
17 the chartered banks.

1 SUBMISSION BY MR. FRANK O'HEARN

2
3 THE CHAIRMAN: The meeting will resume.
4 Mr. O'Hearn.

5 MR. O'HEARN: Mr. Chairman, and members
6 of the Royal Commission. I wish first of all to
7 take this opportunity to thank you for taking in
8 my brief and supplement and for giving me this
9 opportunity of a public hearing. I must say
10 that this is more than the House of Commons and
11 the Senate Committee on Banking and Commerce did
12 for me, when I submitted a similar brief before
13 them back in 1954 when the bank charter renewals
14 were under consideration by Parliament. At that
15 time -- .

16 THE CHAIRMAN: Mr. O'Hearn, you may
17 read your brief, but we expect you to confine
18 yourself to your brief. If you read it first,
19 and then there may be some questions.

20 MR. O'HEARN: I have in mind making
21 some suggestions that might save you some --

22 THE CHAIRMAN: No, we have all read
23 your brief, and if you wish to read it you may,
24 that is, the summary of the brief.

25 MR. O'HEARN: Just the short summary?

26 THE CHAIRMAN: Yes, the first two pages.
27 --- Mr. O'Hearn read the first two pages of his
28 brief.

29 THE CHAIRMAN: Thank you, Mr. O'Hearn.
30 Any questions? If there are no questions, thank

Nethercut & Young

Toronto, Ontario

- 1382 -

1 you very much, Mr. O'Hearn.

SUBMISSOON OF THE COMMUNIST PARTY
OF CANADA

APPEARANCES

Mr. L. Morris

Mrs. P. Clarke

Mr. N. Clarke

--- Mrs. Clarke reads summary.

THE CHAIRMAN: Are there any questions?
Apparently there are no questions. We have all
read your brief thoroughly and appreciate very much
having you submit it.

MRS. CLARKE: Thank you.

1
2
3 SUBMISSION OF MR. A.H. CAMERON
4

5 MR. CAMERON: Mr. Chairman, this is rather
6 a long brief, and it has been in your hands and I don't
7 propose to read it.

8 THE CHAIRMAN: Have you a summary?

9 MR. CAMERON: Yes, there is a summary at
10 the beginning. If you wish, I shall read it.

11 THE CHAIRMAN: That is under "General
12 Remarks and Recommendations"?

13 MR. CAMERON: Yes, sir.

14 THE CHAIRMAN: I do not think it is
15 necessary for you to read the whole of that. We have
16 all read this. If you wish to make certain general
17 comments and leave the way open for questions, if
18 that suits you.

1 MR. CAMERON: Very good, sir.

2 THE CHAIRMAN: Whichever you prefer.

3 MR. CAMERON: The gist of the general
4 remarks and recommendations is that I think the
5 financial system is suffering from a bit of a
6 malaise which is developing certain cracks. The
7 root cause of this is probably what people have
8 done to money over the last three generations and
9 the suggestions which I would make are not going
10 to solve this problem; they are merely suggested
11 corrections in the machinery in the central bank
12 area, in the finance department and in the opera-
13 tions of the capital markets which might make the
14 system function a little better in the conditions
15 under which we live.

16 Since you gentlemen have read the brief
17 and the suggestions contained therein I would not
18 wish to take up your time by reading it any further
19 and will await any questions that you might have.

20 COMMISSIONER MACKINTOSH: I have some
21 questions, Mr. Cameron, on your interesting brief.
22 You have some proposals concerning the Bank of
23 Canada and particularly the board. If I recall you
24 suggest quite a small board sitting perhaps two
25 or more days a week. I was wondering if this was
26 not getting near substituting a committee for the
27 governor of the bank. I was a little uncertain
28 as to whether this was a board or a day to day
29 management committee. Would you care to comment on
30 that?

1 MR. CAMERON: Possibly it would turn out
2 to be closer to a management committee such as the
3 Bank of England has, sir.

4 COMMISSIONER MACKINTOSH: Are you
5 thinking of the Treasury Committee of the Bank
6 of England?

7 MR. CAMERON: Well, there are four full
8 time directors --

9 COMMISSIONER MACKINTOSH: They are
10 executive directors.

11 MR. CAMERON: Yes, sir. There are 12
12 part-time directors who are around the bank at
13 least once a week and sometimes more often. Quite
14 a few of them are people with banking experience.
15 I think at the time of the Radcliffe Report three
16 of them were members of merchant banks, one was
17 the head of a small clearing bank, one was the
18 head of a bank doing business abroad, mainly in
19 South America, most of the other seven represented
20 industry, insurance, trade and shipping and
21 trade unions.

22 What I had in mind was that Ottawa is
23 fairly convenient to Toronto and Montreal and it
24 might be possible to have as directors of the bank
25 and available two days a week people of a
26 financial or academic background who could advise
27 the governor as to what was going on in the
28 financial community as well as what they thought
29 ought to be done under any given set of circumstances.
30 They would assist the governor if he had some points

1 that he wished to make to the government and at the
2 same time if the governor got off on the wrong foot
3 with some idea they might be able to be a brake on
4 him.

5 COMMISSIONER MACKINTOSH: You would, I
6 take it, abandon the regional representatives,
7 would you?

8 MR. CAMERON: Yes, sir, I feel that the
9 meetings of the board have been rather infrequent
10 and that -- I don't know because I have never been
11 to a bank board meeting but I understand that
12 quite often the proceedings consisted of the
13 governor perhaps advising the board rather than
14 the other way around, as to his view of the
15 economy and therefore that the regional repre-
16 sentatives perhaps did not contribute very much
17 to the operation of the bank other than to provide
18 a facade for the government.

19 COMMISSIONER GIBSON: Do you see these
20 new directors that you speak of as active
21 directors spending a couple of days a week but
22 not full time; in other words, they would not be
23 executive directors, they would not have a particular
24 share of responsibility?

25 MR. CAMERON: No, sir, I would look at
26 them as being not full time employees but rather
27 elder statesmen.

28 COMMISSIONER GIBSON: Available on an
29 advisory capacity at a policy level?

30 MR. CAMERON: Completely advisory but at

1 the policy level and also as sources of information.

2 COMMISSIONER BROWN: Would these be people
3 who had retired from other organizations?

4 MR. CAMERON: Not necessarily, sir. The
5 Bank of England manages to justify using at the
6 time directors who are still active in a merchant
7 bank, in one case, in another case in a clearing
8 bank, in another case a foreign bank. We had as
9 executive directors in the Bank of Canada an in-
10 stance of a general manager of a life insurance
11 company who is not retired. In the case of the
12 Nederlandsche Bank they have two directors who
13 teach in the school of economics two days a week.
14 I do not have in mind quite the counterpart of
15 the Federal Reserve Board where the members are
16 full-time.

17 COMMISSIONER BROWN: No question about
18 any conflict of interest at all?

19 MR. CAMERON: The English had a committee
20 of inquiry after a change in the bank rate some
21 years ago to see whether there had been a conflict
22 of interest in the position of some of the directors
23 vis-a-vis their own institutions when they were
24 made privy to the knowledge that the bank was going
25 to change the bank rate and I think it is fair to
26 say that the directors were exonerated. I think
27 you would be able to find people of equal integrity
28 in this country.

29 COMMISSIONER MACKINTOSH: You would not
30 think of a board slightly larger than you suggest

1 with some regional representation and an executive
2 committee of the sort you suggest meeting much
3 more frequently plus perhaps some executive
4 directors who in the case of the Bank of England
5 are officials of the bank?

6 MR. CAMERON: Well, that might solve
7 the problem, sir. I really felt that the pre-
8 sent board were rather remote from the operation
9 of the bank and that the bank would benefit by
10 having some structure of advisors whether you
11 want to call it a board or a court or executive
12 directors.

13 COMMISSIONER GIBSON: You are not
14 proposing to reduce the executive power or the
15 power of decision of the governor, you want to
16 give him more continuous advice, is that a correct
17 statement?

18 MR. CAMERON: I think that is how I
19 would prefer it, sir.

20 COMMISSIONER BROWN: How do you visualize
21 the relationship between this board and the govern-
22 ment in the week to week operation of the bank?

23 MR. CAMERON: I do not suppose it would
24 differ very much from the present executive
25 Committee in the government except that having
26 more people who are not government employees full-
27 time on the board they might be able to speak a
28 little more forcefully if circumstances so required.

29 COMMISSIONER LEMAN: Mr. Cameron, in
30 answer to Mr. Gibson's question I believe you said

1 you did not want to reduce the authority of the
2 governor but provide him with more advice.
3 Nevertheless, reading your brief I got the
4 impression that you would like to reduce consider-
5 ably the area of decision of the governor. For
6 instance, you say let us have the department of
7 finance outside the whole area make the whole
8 set of decisions in the area of debt financing.
9 Therefore, you would take that away from the
10 governor?

11 MR. CAMERON: Yes, I think it could be
12 hived off as a responsibility of the finance de-
13 partment and certain other things which may have
14 been done without legal authorization in the past
15 should be either legalized or prohibited.

16 COMMISSIONER LEMAN: Therefore, shouldn't
17 we gather that on the whole you would like to
18 reduce the overall authority of the governor?

19 MR. CAMERON: Or legalize it in areas
20 where it has been used in the past without specific
21 legal authority. But this would not have a bearing
22 on the presence of extra directors reducing the
23 governor's power.

24 THE CHAIRMAN: You are of the opinion
25 that the functions that have been performed by the
26 governors should be legalized. Do you think they
27 should be legalized or do you think he should be
28 shorn of those functions that he has been per-
29 forming according to what you suggest without legal
30 authority?

1 MR. CAMERON: I think this is a matter
2 in some cases, sir, when they should be legalized
3 and in other cases that they should perhaps be
4 prohibited but in any event that the area for the
5 use of moral suasion should be reduced.

6 COMMISSIONER MACKINTOSH: Upon another
7 point that you raised here, the responsibility of
8 the bank to the government, you suggest that this
9 should be specified in the statute? Have you any
10 judgment as to whether the terms of the British
11 Act would be adequate or do you wish some further
12 enactment?

13 MR. CAMERON: I think the British Act
14 does specify enough that there would be no likeli-
15 hood of misunderstanding arising in the public's
16 mind as to what is the policy of the Bank of
17 England or that of the government. In fact, one
18 of the chancellors went so far as to refer to the
19 bank as "my creature".

20 COMMISSIONER MACKINTOSH: You would
21 agree that there should, however, be some residuary
22 independence of the bank?

23 MR. CAMERON: That is correct.

24 COMMISSIONER MACKINTOSH: This is one of
25 the cases where you have to try and accommodate
26 two incompatible situations. There must be both
27 responsibility but also independence of view if
28 that is to be achieved. It cannot be logical but
29 in preference it can?

30 MR. CAMERON: I think also to put it in

1 another way, as I have said in the brief, you
2 should never have a situation where a Minister of
3 Finance can play Pontius Pilate and say: "The
4 bank is not my creature, I am not responsible for
5 it, we accept no responsibility."

6 COMMISSIONER BROWN: In cases of
7 dissidence in policy, there would be a presumption
8 that the government policy should prevail?

9 MR. CAMERON: Yes, sir.

10 COMMISSIONER BROWN: The question arises
11 should this be done by way of public directive
12 so that everyone knows there has been disagree-
13 ment and what has been the decision?

14 MR. CAMERON: I think Mr. Towers was of
15 the opinion that if there was disagreement which
16 could not be resolved by private conversation
17 that the governor ought to resign. Possibly there
18 is something to be said for having this direction
19 wielded privately rather than publicly.

20 COMMISSIONER GIBSON: If you cannot state
21 it privately then the government would presumably
22 give a directive to central bank and the governor,
23 if he disagreed, would resign at that point?

24 MR. CAMERON: Yes, but there are provisions
25 in the statutes of five or six different Commonwealth
26 central banks that lay down rather alternative pro-
27 cedure if there is a disagreement but I do not re-
28 call specifically that the orders have to be issued
29 publicly.

30 COMMISSIONER BROWN: This is one of the

1 important points, I think, is it not? There is
2 no longer an automatic control of monetary in-
3 flation and I would just like to get your opinion
4 of the extent to which it is necessary that the
5 public be informed if the government is using the
6 central bank to further political ends rather than
7 economic.

8 MR. CAMERON: If the governor went along
9 with it I guess you would still have to rely on
10 somebody interpreting the sense. If the governor
11 did not go along with it his resignation would be
12 as Mr. Towers once put it, "A red light".

13 COMMISSIONER LEMAN: I can understand
14 this is the real object. There is here a further
15 step. When Mr. Towers made his statement there
16 was no provision for a government directive. He
17 simply said on disagreement the governor should
18 resign. If you are going to provide for a director-
19 ate then I do not think you should assume that
20 being issued a directive by the government the
21 governor should then automatically resign. There
22 is not much use issuing a directive if that is the
23 only result of it. I would assume the governor
24 would consider whether he could in integrity carry
25 out the directive and if he could not he would
26 resign. But the degree of absolute approval in
27 these areas is often not very high and I can con-
28 ceive of many circumstances in which the governor
29 having argued against the directive could, in good
30 faith, carry it out when the government had made

1 the decision. In other circumstances he would not.
2 But just the issue of a directive which had the
3 automatic result of the governor resigning it
4 seems to me would shorten the process.

5 In this connection, Mr. Cameron, you
6 suggest that the Act itself should specify the
7 governor's tenure of suspension and grounds for
8 removal. What did you have in mind there? What
9 kind of grounds for removal did you have in mind?

10 MR. CAMERON: The present act, as I read
11 it, sir, does not specify any.

12 COMMISSIONER LEMAN: Then you would start
13 with gross misconduct perhaps. But how far would
14 you go? If you imagine this mechanism you have
15 just described about the resignation of the
16 governor under certain circumstances, is that what
17 you have in mind by the expression "grounds for
18 removal"?

19 MR. CAMERON: That is correct, sir, but
20 I think it would be in the public interest if we
21 were able to avoid a repetition of recent events.
22 I am sure that if the government felt that it no
23 longer had confidence in the president of the
24 Canadian National Railways that a method would be
25 advanced to abrogate his contract without a full
26 debate in Parliament and the committee of the
27 Senate holding a hearing.

1
2
3 COMMISSIONER LEMAN: Could you be fairly
4 specific on what you would suggest as grounds for
5 removal to be stated in the law?

6 MR. CAMERON: I would think loss of confidence
7 by the Governor in Council would be sufficient grounds.

8 COMMISSIONER LEMAN: Isn't that pretty close
9 to saying the Governor's tenure is subject to pleasure?

10 MR. CAMERON: That is practically the same
11 thing.

12 COMMISSIONER BROWN: This would be done
13 without any public discussions?

14 MR. CAMERON: I think there would be some
15 public discussion.

16 COMMISSIONER BROWN: You say you wish this
17 done without any discussion in Parliament or the
18 Senate: Where would there be public discussion?

19 MR. CAMERON: There would be questions
20 raised and some sort of debate, no doubt, but perhaps
21 it is too much to hope for, but I don't think we
22 should be treated to another 1961.

23 COMMISSIONER GIBSON: Going back to what
24 Dr. Mackintosh said, it seems to me you are almost
25 suggesting that if the government were to issue a
26 directive the Governor would have to resign because
27 this would indicate there was disagreement. Isn't
28 the degree of disagreement important in this? I
29 think we are all feeling around on this particular
30 point.

MR. CAMERON: I would assume that if the
Governor resigned he would issue a statement on the
area of disagreement which would elicit one from
the Cabinet -- the Minister of Finance.

1
2
3 COMMISSIONER GIBSON: But suppose a directive
4 were given to the Central Bank to the effect they
5 were to carry out such and such a policy, such a
6 directive would not be given unless there had been
7 private disagreement earlier, and it would surely
8 depend on how important the matter was and how great
9 the degree of disagreement as to whether or not the
10 government would want the Governor's resignation, or
11 whether he should give it, would't it?

12 MR. CAMERON: I would think so.

13 COMMISSIONER GIBSON: We are interested, I
14 think, in getting your ideas of when you get a
15 sufficient degree of difference that the Governor
16 should resign. If he has to resign whenever there
17 is a slight disagreement, then he has very little
18 independence. On the other hand, if he can stay
19 in power regardless of the degree of disagreement
20 perhaps he has too much independence. Could you
21 enlighten us as to the area in between here?

22 MR. CAMERON: Well, suppose it was a dis-
23 agreement on the question of the government borrowing
24 a substantial sum of money from the Central Bank which
25 could be treated in terms of printing money on a
26 large scale: I would think a Governor who disagreed
27 with this might be willing to make his disagreement
28 privately known to the government, because he has got
29 too much money or too little money, and perhaps stay
30 in office and reluctantly go along with the directive
up to a point, and then might be willing to say to
the government, "I have done enough. I will go no
further. You can fire me," or, "I resign", whichever
you like.

1
2
3 On minor matters perhaps the Governor may
4 be willing to go along against his better judgment
5 but would ask for a directive to keep his own skirts
6 clean if there were results which he did not deem
7 sufficient to cause him to resign. Or, to put it
8 another way, he might feel he was doing more good
9 staying on the job and acting as a brake on the
10 government and making a public issue about the matter
11 than being replaced by a more pliant creature, but
12 by requiring a directive by the government he would
13 be fastening responsibility on them, to the benefit
14 of posterity if a year from now the government wanted
15 to blame the Bank for the results of its policy.

16 COMMISSIONER GIBSON: And looking at it
17 from the side of the government, suppose there were
18 some disagreements, some directives about matters
19 which were perhaps not of major importance, or perhaps
20 not of major degree -- there could be a difference in
21 degree as to the amount of expansion that ought to
22 occur -- and suppose the government did issue a
23 few directives of this kind, and in this way the
24 Governor of the Central Bank made his position clear
25 in public, when would the government be able to ask
26 him to submit his resignation? They might not like
27 this process of issuing one directive after another.

28 MR. CAMERON: I didn't quite get the question.

29 COMMISSIONER GIBSON: I am getting back to
30 what is the position of the government if they are
not happy with the conduct of the Governor of the
Central Bank, and there are a number of smaller
incidents rather than major ones on which directives
are issued, and you say they should have the power to

1
2
3 replace the Governor under what circumstances -- or
4 ask for his resignation?

5 MR. CAMERON: If they had lost confidence
6 in him.

7 COMMISSIONER GIBSON: And it is just enough
8 to state they have lost confidence in him?

9 MR. CAMERON: I think there is a lot of
10 master and servant that still presumably -- perhaps
11 the common law.

12 COMMISSIONER MACKINTOSH: You are suggesting
13 a very radical change. As far as I can recollect,
14 nearly all heads of central banks have a fixed term.
15 Now, there are circumstances in which he may resign
16 or be removed, but some emphasis in the past has
17 been placed on this assurance of a fixed term. To
18 reduce a Governor of the Central Bank to holding
19 office during pleasure is a pretty radical step,
20 and I would think probably obviates the need for
21 any directives, whereas if you provide for directives
22 you can probably leave the fixed term, subject, of
23 course, to removal for gross misconduct. What would
24 you think of that?

25 MR. CAMERON: Possibly that might be a
26 better way, sir. In the United States I think on
27 two occasions the President of the Federal Reserve
28 Board -- his term as Chairman had not expired and
29 he submitted his resignation to the incoming President
30 and was promptly reappointed. Whether he knew that
beforehand or not is another question. There is a
discussion extant at the moment making the term
of the Chairman of the Board of Governors co-terminable
with that of the President.

1
2
3 COMMISSIONER MACKINTOSH: That is another
4 point not raised in your brief, but something that
5 was raised in another submission: Do you think that
6 would be a good system -- the term of the Governor's
7 appointment should be like that?

8 MR. CAMERON: I would hope not.

9 COMMISSIONER MACKINTOSH: Would you feel
10 that would undermine the independence of the Bank
11 if he changed with a change in government?

12 MR. CAMERON: I think it would reduce it
13 to a complete political pawn.

14 COMMISSIONER MACKINTOSH: Without going
15 into them in detail, your general bias is toward
16 fixing specifically in legislation the rules under
17 which the Bank may operate. That is simplifying it,
18 briefly?

19 MR. CAMERON: Yes.

20 COMMISSIONER MACKINTOSH: I have been
21 bothered about this. Many things in the Federal
22 Reserve Act are made specific, partly for historical
23 reasons and partly because the Federal Reserve is
24 a creature of Congress and the Treasury is a creature
25 of the President, and this sets up a line of tension
26 which requires more detail. Is there any danger of
27 losing the advantage which we have on occasion in
28 this country, because we are a relatively small
29 country, of leaving some degree of flexibility and
30 room for agreement. Do you mean in the case of, say,
the cash ratio and liquid ratio, to reduce these fixed
rates or leave the bank with a range in which it can
operate?

MR. CAMERON: I think, if the cash ratio is

1
2
3 stated in the Act and there is procedure for
4 changing it -- a certain range. As to liquidity
5 ratios, banks always did maintain at some level,
6 which I presume was dictated by their own prudence
7 as bankers, and perhaps to some degree by the actions
8 of their competitors. I think if the Governor had
9 a mechanism specified in the Act to set a ratio,
10 a varying ratio, that this would be an improvement
11 over the system under which you might get the bankers
12 in a closed room and say, in effect, "You fellows
13 will do as I say or I will raise your cash ratios
14 on you." The effect of the rise in cash ratios,
15 say to a level of 8 per cent, would be a very severe
16 squeeze on the banks, and if a Governor ever did
17 wish to do the thing it would be, in my judgment a
18 form of blackmail. I think it is better than it be
19 in the Act.

20 COMMISSIONER MACKINTOSH: What you mean is,
21 you want power in a statute to fix this sort of ratio
22 if it is desirable to fix it?

23 MR. CAMERON: It is much better to have a
24 set of ground rules that everybody understands than
25 have them change when the Governor or the government
26 thinks they ought to be changed.

27 COMMISSIONER BROWN: A lot of this has been
28 in the field of experimentation, in the field of
29 monetary policy.

30 MR. CAMERON: I think that is correct.

COMMISSIONER BROWN: What would you think of
some sort of legislation so that if something was
done in this way that was not specifically spelled out,
that it was effective only for a certain period of time,

1
2
3 and then there had to be legislation backing it up?
4 Because otherwise isn't the tendency to lose the
5 flexibility we have for certain experimentation?

6 MR. CAMERON: I think your suggestion that
7 innovations be tried for a short period and then
8 enacted into legislation has much to be said in its
9 favour except for one thing, that it may result in
10 the Bank Act getting reopened every year, and since
11 the banks' charters, I believe, lapse under the Bank
12 Act, you have the banks in a situation of not knowing
13 where they stood between now and the next session
14 of Parliament -- at least, they would know no further
15 than that. And since the Bank Act is decennial you
16 could not say very well that this innovation should
17 only last until the next division on the Bank Act.
18 It may be nine years.

19 COMMISSIONER BROWN: I think this could be
20 done within certain clauses of the Bank Act. In other
21 words, the whole Bank Act would not necessarily come
22 into it. I think there are ways of getting around it
23 if the idea were cogent, because the same arises
24 under the present system, that unless you have room
25 for flexibility you develop certain rigidities that
26 are locked in for a ten-year period.

27 MR. CAMERON: I think on the subject of
28 secondary reserve ratios they ought to be able to
29 devise a range which the government could change
30 on notice of one, two or three months to cover any
exigencies, and if the range were found to be somewhat
on the low side because of, shall we say, a sharp
influx of foreign currency or outflow of foreign
currency, such as we saw in 1950, that you may be

1
2
3 looking at a situation which would require a rise
4 in cash reserve ratio, and between the two you could
5 deal with almost anything that might turn up. I
6 particularly would like to avoid some degree of
7 flexibility where in an emergency it could be used
8 at the discretion of the Governor, to change the
9 banking system every year or every few months as
they get some new idea they would like to try out.

10 COMMISSIONER BROWN: You would have to have
11 agreement, would't you?

12 COMMISSIONER MacKEEN: If everything were
13 fixed by statute, would't there be too great a degree
14 of rigidity due to conditions that may arise from
15 time to time where the Governor or the government
16 directives may be required to exercise more discretion?

17 MR. CAMERON: I think the cash ratios that
18 you presently have -- the Governor has the power to
19 raise them on notice, and if the ratio was raised
20 from 8 per cent to 9 per cent, this would require
21 banks to deposit something in the order of another
22 \$150 million. With an 8 per cent reserve ratio the
23 present reserve serves as a basis for twelve times
24 as much in the way of total footage in the banking
25 system. With a 9 per cent reserve ratio, bearing
26 an extra \$150 million, you would be shrinking the
27 banking system by around 1.3 billion. And you have
the right to go up to 12 per cent, which could put
on all the credit squeeze that anybody would want.

28 COMMISSIONER LEMAN: Except that a require-
29 ment for a change in the percentage does not have to
30 be necessarily sudden. The Bank could give a directive
that the new cash ratio must be met within X months.

1
2
3 MR. CAMERON: Well, the actual rise can only
4 be done on a certain period of notice.

5 COMMISSIONER LEMAN: I thought you were
6 describing how violent the effect of, say, a percentage
7 change could be on the system. I agree it would be
8 very violent if it was done over too short a period.

9 MR. CAMERON: I was saying in reply to
10 Mr. MacKee that facilities existed for prior notice,
11 to deal with the banking system in a way which would
12 look after exigencies -- there is a rigidity, but
13 it still has lots of room in it.

14 COMMISSIONER GIBSON: Take the situation,
15 I think it was late in 1955, when there was a very
16 acute increase of loans with some considerable fear
17 of inflation. At that time it was not an increase
18 in the cash reserve requirement, but there was an
19 understanding with regard to bank loans -- an
20 effort in an informal way to put a ceiling on them,
21 and there was also an understanding through large
22 loans for capital purposes -- I am not sure I have
23 got the date just right, but you know the time I
24 am talking about -- and these methods worked for
25 the time being, as temporary measures, not too badly.
26 There may have been better ways of doing it, but at
27 the time and under the circumstances the Central
28 Bank thought this was as good a way of coping with
29 the situation as any, and the chartered banks went
30 along with it. I would not suggest for a minute
they were forced into going along with it. There
was a real problem. Would you say that sort of thing
should not have been done, and the Bank of Canada
should just have relied on its legal power to increase

1
2
3 the cash reserve percentage?

4 MR. CAMERON: No, sir. I think the Central
5 Bank should have the power.

6 COMMISSIONER GIBSON: But how do you outline
7 a power to put ceilings on banks loans? This is a
8 very extreme power, and this was an informal agreement.
9 Would you want to put that kind of thing in legislation?

10 MR. CAMERON: I think the liquidity asset
11 ratio variation would have had the same effect if it
12 were embodied in the legislation.

13 COMMISSIONER GIBSON: That came a bit later,
14 yes. That was also one of these informal agreements
15 in much less of an emergency situation.

16 COMMISSIONER MACKINTOSH: This reflects on
17 the point I was raising: It seems to me you have to
18 have many specific rules if you are dealing with
19 something like 1100 banks in the United States, and
20 there ought to be a smoother way of dealing with it
21 when you are dealing with a very few banks in Canada;
22 that you do not need as many -- I don't disagree
23 with the contention that there should be statutory
24 authority for this, but it seems to me if you are
25 dealing with only a few banks -- and I forget how
26 many there are at present -- there should be methods
27 of agreement and common acceptance of ideas which
28 really works better than highly specific statutory
29 direction as against mere authorizing action.

30 COMMISSIONER BROWN: To carry on that, it
could be said that if you did authorize it by statute
you would have to, by statute, give the Central Bank
more authority than it has now.

MR. CAMERON: I think perhaps its authority

1
2
3 has been rather limited, sir, if it chose to exercise
4 it by suasion. If you get the banks to agree to
5 a number of things which Parliament might not wish
6 to embody in legislation.---

7 COMMISSIONER BROWN: The banks have the
8 choice of saying no, and by that means it becomes a
9 matter of public debate. The banks are in a position
10 of forcing a public debate on it if they had so wished.

11 MR. CAMERON: Maybe it is not a subject that
12 the public would understand very well, and I would
13 rather see Parliament confer power on the Bank of
14 Canada than have the Governor exercise power by
15 the threat expressly implied that he might use other
16 powers he did have conferred on him legally if the
17 banks or anybody else did not come into line.

18 COMMISSIONER GIBSON: It is this question
19 of suasion: Are you against it altogether?

20 MR. CAMERON: I think the Central Bank is
21 a very powerful institution, sir, and its exercise
22 of suasion is therefore a very powerful force. I
23 think it is rather dangerous to leave it in the
24 discretion of one man.

25 COMMISSIONER GIBSON: Would you like to
26 narrow that discretion by being more specific about
27 what the powers of the Central Bank are in the light
28 of circumstances from time to time.

29 MR. CAMERON: That is correct.

30 COMMISSIONER GIBSON: Would you rule out
the use of suasion in what appeared to be an emergency
or a very unusual situation?

MR. CAMERON: I don't suppose you can rule
it out entirely, and if the situation were an

1
2
3 emergency obvious to everyone ---

4 COMMISSIONER GIBSON: But this is seldom
5 the case except in a war. Would you agree the kind
6 of situation we had in late 1955 was an emergency
7 situation from a monetary credit point of view?

8 MR. CAMERON: It was threatening to generate
9 inflationary pressures, and I think some of us rather
10 expected there may be a rise in cash reserve ratios.

11 COMMISSIONER GIBSON: The sense of what you
12 say seems to me to suggest that you won't quite say
13 that the Central Bank should not use its powers of
14 persuasion from time to time. On the other hand,
15 you like to have it regularized as early as possible,
16 and they should not use some form of persuasion as
17 a regular instrument of monetary policy year after
18 year; is this a fair statement?

19 MR. CAMERON: I don't think they should
20 be in a position to bring new directives or ideas
21 on the banking system unless Parliament has specifically
22 given them the power. For instance, I believe the
23 Bank at one time took a dislike to loans made to
24 finance companies and requested that a ceiling be
25 put on them. I am not trying to hold any brief for
26 the finance companies, but it may be someone else
27 tomorrow -- some other segment of industry -- and I
28 don't think it is too good that one individual should
29 be allowed to single out any specific area of the
30 economy unless Parliament has given them the power.

31 COMMISSIONER GIBSON: In other words, a
32 lot hinges on what you would regard as an emergency
33 situation?

34 MR. CAMERON: That is correct.

1 COMMISSIONER MACKINTOSH: Are you not
2 underestimating a little the power of the chartered
3 banks, not exactly shrinking?

4 MR. CAMERON: Well, I think they have a
5 certain amount of power, but their charters run
6 until the next decennial revision.

7 COMMISSIONER BROWN: You make two re-
8 commendations, one with respect to the bank being
9 directed to replace bills or run them off at the
10 weekly option, and you have another recommendation
11 that the bank again be obliged to arbitrarily set
12 the bank rate. Are those two tied up together
13 at all?

14 MR. CAMERON: Yes, they are in a certain
15 way. That is my understanding, that the Bank of
16 Canada makes two bids, treasury bill option, one
17 for bills which they want for portfolio, and
18 another one as a sort of reserve bid in case the
19 market did not cover the tender.

20 The bank, if it wanted to, could bid a
21 ridiculously high price, ridiculously low yield
22 for the bills if it wanted, if it wished to
23 influence the average tender rate and hence bank
24 rate under the current rules. If we did fix the
25 bank rate, of course, this would not matter to
26 the same degree.

27 In the United States the Federal Reserve
28 Board is allowed to replace bills which it has
29 in portfolio and which are falling due, by buying
30 bills at the option. It is also allowed to run them

1 off, but it is not permitted to increase its
2 holding of bills over and above those which it is
3 replacing, without going into the open market to
4 do so. That particular aspect is rather a tech-
5 nical one and does not exactly tie into the bank
6 rate, except if you have bids both high and low,
7 bid unduly high in price to regular bank rates.

8 COMMISSIONER MACKINTOSH: I am not sure
9 of my ground here. Is it not the fact that both
10 in the United Kingdom and the United States the
11 complement of this system is an informal arrange-
12 ment that the market will take up the bills?

13 MR. CAMERON: That is the case in the
14 United States, I believe, sir, and in the United
15 Kingdom, that the market collectively --

16 COMMISSIONER MACKINTOSH: Has this not
17 grown up because, if I remember, Treasury bills
18 only appeared about 1932 or thereabouts, and
19 there has been a continual building up of the
20 markets. Is it not a question whether the market
21 is now sufficiently broad and deep that you can
22 get away from this direct intervention of the
23 Bank of Canada? I just don't know.

24 MR. CAMERON: I think there was one
25 occasion in August 1959 when it is possible that
26 there were not enough bids to cover the tender.
27 It is also possible that on that occasion the Bank
28 of Canada did not even have the reserve bid to cover
29 the annual bills because the Minister saw fit to
30 withdraw part of the offering, and he did not say

1 the tender was not covered but he allowed that the
2 low bids in price and high bids in yield were
3 ridiculous - in other words, that the Bank of
4 Canada, if it did have a reserve bid, was also
5 guilty of putting in a ridiculous bid, which leads
6 to the conclusion that perhaps on this occasion
7 they did not have a reserve bid.

8 Under those circumstances perhaps the
9 market is not big enough to be sure at all times
10 there is a bid to cover the tender, but in most
11 situations I think it is.

12 COMMISSIONER BROWN: What is the difference
13 between exercising some influence on the one side
14 of the market by letting bills run off and replacing
15 and buying additional bills on the other side of
16 the market? Why would you be in favour of the
17 bank being able to influence it on the one side
18 but not on the other?

19 MR. CAMERON: Well, I believe that the
20 more the bank shows its hand in the market the
21 better. It obviously cannot run bills off publicly
22 until the next bank statement but certainly its
23 subscriptions over and above those which are going
24 to refundings can be revealed to the market place
25 and a clue of the bank's policy of the moment.

26 COMMISSIONER BROWN: Would the same re-
27 sult be achieved if there was public disclosure of
28 how the bank finished up on the bill option, instead
29 of waiting for the following Wednesday?

30 MR. CAMERON: Yes, I think it could. This

1 is a matter we are in ignorance of until the
2 following Wednesday and then there may have been
3 enough extraneous transactions, but you are never
4 quite sure.

5 COMMISSIONER BROWN: The thing I am also
6 trying to get at is, unless an arbitrary bank rate
7 is set, is there an assumption that the Bank of
8 Canada is influencing the bank rates each week,
9 and if this is so is this a desirable thing, or
10 should they be doing this in the absence of a
11 declared bank rate?

12 MR. CAMERON: I think there is a great
13 deal to be said for setting the bank rate openly
14 as a symbol of the central bank banking intent,
15 but doing it through the back door is a less honest
16 way of doing it, and you can never be sure because
17 it is so easy for miscalculations to enter into even
18 the bank's "fiddling" with it by way of the tender
19 and by way of loosening or tightening the chartered
20 banks especially if you have misjudgments on their
21 part as to the effect of these other actions.

22 I think by indirection they can only
23 take a stab at pushing the bill tender one way or
24 the other. I would rather see it done in an open
25 fashion, return to the old system.

26 COMMISSIONER MACKINTOSH: That is, you
27 make the bill market conform to the bank rate, if
28 not the bank rate conform to the bill market.

29 MR. CAMERON: I think the bill market
30 would fluctuate in relation to bank rates, whether

1 of its own volition or in part through central
2 banking interference. It would probably be some-
3 thing that varies from week to week. I think under
4 these circumstances there would be more of a dis-
5 position to blame the markets than to blame the
6 bank for the level of bill tender, and we would
7 not always be looking at things like the cyclical
8 repetition of the 3.06 high as being meaningful
9 bank policy.

10 COMMISSIONER GIBSON: Do you think the
11 market would regard the Bank of Canada as being
12 more directly informed under the present system
13 than they would so regard them if we had a fixed
14 bank rate?

15 MR. CAMERON: Yes, I think at the moment
16 they are regarded as being more involved in in-
17 fluencing the average rates than under a fixed
18 bank rate.

19 COMMISSIONER GIBSON: This is a very
20 important part of their business, whether they
21 have a fixed bank rate or not. You agree with
22 that?

23 MR. CAMERON: That is correct.

24 COMMISSIONER GIBSON: So they are always
25 in this market. I just wondered why there is so
26 very much difference in this particular thing
27 through circumstances.

28 MR. CAMERON: Well, it is possible to
29 influence the average rate by paying more for your
30 bills than you have to. I am not saying this is

1 done, but it could be done, may have been done.

2 COMMISSIONER GIBSON: Having a fixed
3 bank rate would not take the Bank of Canada out of
4 the bill market?

5 MR. CAMERON: No.

6 COMMISSIONER GIBSON: They would still
7 be free to borrow as they saw fit.

8 MR. CAMERON: One would then presume
9 that they would try to get their bills as cheaply
10 as possible.

11 COMMISSIONER GIBSON: What about the
12 objections to the fixed bank rates, that there
13 are times when, let us say, interest rates rise
14 rapidly and the central bank has to prolong this
15 trend - maybe an international trend, strong trend,
16 and we have seen this happen a couple of times in
17 Canada, one very strongly - if they just keep
18 raising their set bank rate, this may add an im-
19 pression that they agree with this kind of thing,
20 that the thing has got beyond them and they are
21 just being dragged along.

22 I think it is true to say that it was a
23 situation of this kind that led to the floating
24 bank rate, and one can understand the rather
25 embarrassing position in which the central bank
26 found itself at that time.

27 What weight do
28 you give this in your thinking about this, when
29 you say we should have a fixed rate?

30 MR. CAMERON: This is a small country and

1 it is subject to international capital flows.
2 I presume our bank rate under the present system
3 can get dragged along with others willy-nilly
4 anyway. If we had a fixed bank rate and we
5 had to adjust it because of these international
6 complications, I have no doubt that each change
7 would be accompanied by a statement that notwith-
8 standing the view of the Bank of Canada it was
9 necessary to go along with the trend in other
10 markets.

11 COMMISSIONER GIBSON: Maybe they wouldn't
12 want to say that?

13 MR. CAMERON: I think we are getting
14 closer to the point where we must admit inter-
15 national forces to a degree we have not been
16 willing most of the years since the war.

17 THE CHAIRMAN: We will now adjourn to
18 two o'clock.

19 --- Adjournment.

1
2 --- On resuming at 2.30 P.M.

3 COMMISSIONER MACKINTOSH: The hearing
4 will resume. The Chairman is delayed a short time:
5 He will be in later but I think we might continue
6 with the discussion.

7 I have some matters I would like to raise
8 on the section of the brief entitled "Conflicts of
9 Interest". Have other Commissioners points they
10 would like to take up on matters ahead of that --
11 the money market or the Governor's report?

12 COMMISSIONER GIBSON: Mr. Chairman, I
13 would like to pursue the question of bank rate a
14 little farther if that is appropriate.

15 COMMISSIONER MACKINTOSH: Surely.

16 COMMISSIONER GIBSON: Mr. Cameron, would
17 you mind giving us a little more of your ideas as
18 to why we should have a fixed bank rate, that is,
19 a bank rate for which the Central Bank takes
20 responsibility? You, in your brief and in your
21 comments this morning, made it clear that you were
22 not very happy about the floating bank rate. Would
23 you say a little more about the possible advantages
24 of a bank rate which the Central Bank fixes itself?

25 MR. CAMERON: I think basically it is the
26 one official signal which the Central Bank can give
27 as to its view of the economy and as to the proper
28 trend in money rates. The effect is probably more
29 psychological than otherwise. I was particularly
30 struck in reading the English Radcliffe Report by
the fact that a number of witnesses said that the
cost of the money did not make too much difference
in the capital investment programmes of borrowers
but that the sudden shock of raising the bank rate

1
2
3 from 5 to 7 per cent was extremely efficacious.
4 From the explanations given as to why the cost of
5 money per se was not important but a rise of bank rate
6 was the effect, I think, is mainly psychological and
7 is a signal.

8 In the United States where you have half
9 a dozen members of the Federal Reserve Board either
10 making speeches from time to time or appearing before
11 congressional hearings they have an opportunity
12 of augmenting their discount rate by what has been
13 referred to as an open mouth of jawbone policy. This
14 has not been the custom here and in Great Britain
15 there is, I believe, less tendency on the part of
16 the Governor or members of the Court to make public
17 speeches.

18 COMMISSIONER GIBSON: The bank rate as a signal
19 is a little less important if you have an open mouth
20 policy?

21 MR. CAMERON: Well, I think the Americans
22 reinforce their discount rate with an open mouth
23 policy. The Bank of England spokesmen do not say
24 very much very often and in Canada we have not been
25 in the habit of listening to frequent speeches ---

26 COMMISSIONER MACKINTOSH: We had some
27 examples.

28 MR. CAMERON: Unfortunately they did not
29 all concern monetary policy.

30 On the subject of monetary policy we hear
nothing from the directors which would be a counter-
part of the American board members. So that I think
bank rate here, as in England, and unlike the United

1
2
3 States is more important.

4 COMMISSIONER GIBSON: The occasion when
5 such a signal or a signal of the kind of which you
6 speak would be efficacious I take it would be
7 extremely rare; this does not necessarily happen
8 often?

9 MR. CAMERON: I can recall during the latter
10 years of the war having coffee with a gentleman who
11 was closely connected with the Bank of Canada at
12 that time and the bank rate was lowered. He took
13 it very seriously as an indication of the late war --

14 COMMISSIONER GIBSON: That was 1944, wasn't
15 it?

16 MR. CAMERON: I could have been 1944 ---
17 an indication of late war and early postwar monetary
18 policy. This I never forgot and when bank rate was
19 raised in the fall of 1950 I deemed that to be
20 very important even though various people assured
21 me that it really was not because the banks never
22 borrowed money from the Central Bank.

23 COMMISSIONER GIBSON: It was not changed
24 in between in that long interval, was it?

25 MR. CAMERON: No, not to my recollection.
26 I think the events of the next few months proved
27 that that was a significant change in policy.

28 COMMISSIONER GIBSON: There are occasions
29 of the kind we have discussed this morning where
30 a bank rate just really has to follow the market up?

MR. CAMERON: Due to extraneous things,
yes.

COMMISSIONER GIBSON: Do you think the
advantage of fixing the rate as a signal of circumstances

1
2
3 merely outweighs the disadvantages of the odd period
4 like the one in 1955?

5 MR. CAMERON: Very much so, yes.

6 COMMISSIONER BROWN: Would you care to discuss
7 from that point of view the disadvantage that results
8 from the modern concept of getting ahead of your
9 neighbour? If you get a signal that interest rates
10 are going to go up would't you go out and borrow as
11 much as you could before the interest rates go up?

12 MR. CAMERON: I suppose you do, thereby
13 reinforcing the fact that bank rates are supposed
14 to state that more quickly.

15 COMMISSIONER BROWN: Is this an advantage
16 over a monetary change? Is this not really more
17 people getting credit which otherwise they would not
18 get if they continued in the normal course? This is
19 a case of ---

20 MR. CAMERON: It is a case of the race
21 is to the fleetest.

22 COMMISSIONER BROWN: Now, when the bank is
23 just following along behind, in that case the bank
24 is not controlling, is it, it is notifying no one?

25 MR. CAMERON: The bank under those
26 circumstances is responding to extraneous things.
27 I think the floating exchange rate over the last few
28 years has played a part in minimizing those extraneous
29 pressures but I would expect, given some day where
30 you have a fixed exchange rate, in which case those
pressures would become manifest in greater degree
or earlier and to the effect that we have insulated
ourselves with the floating rate of exchange from
these extraneous pressures over the last few years

1
2
3 we may have created other problems for ourselves.
4 I do not think a country this size, dependent upon
5 foreign capital to the extent that we are, can
6 presume to escape the effect of interest rate trends
7 in other countries except by doing things which will
8 react on us adversely in other ways.

9 COMMISSIONER GIBSON: You say with a floating
10 exchange rate we have a greater opportunity to have
11 a more independent bank rate policy or a larger
12 degree of bank rate policy?

13 MR. CAMERON: Yes.

14 COMMISSIONER GIBSON: If you had a fixed
15 bank rate would our bank rate policy be much different
16 possibly from the United States'?

17 MR. CAMERON: I do not think it would except
18 to the extent that the authorities were able to fiddle
19 with it and spot the forward rates of exchange.

20 COMMISSIONER MacKEEN: Mr. Cameron, to get
21 back to the question of the quick asset ratio that
22 we discussed this morning that was presumably a
23 counter-inflationary move on the part of the Central
24 Bank when it was introduced, the additional 7 per cent
25 over the statutory 8 per cent, that was, as I recollect
26 it, a suggestion, perhaps a strong suggestion to the
27 chartered banks from the Central Bank but there was
28 not any compulsion attached to it. In other words,
29 the Central Bank wanted them to do this but they did
30 not force them to do it. It was voluntary on the
chartered banks' part. Am I right?

MR. CAMERON: I don't know, sir. There may
have been an "or else", I don't know, sir.

COMMISSIONER MacKEEN: You mentioned again

1
2
3 that the Central Bank insisted that the ratio be
4 carried up to the extreme percentages such as 90
5 per cent. How would it be possible for the Central
6 Bank to force compliance with such a policy?

7 MR. CAMERON: They could always threaten
8 to use the cash ratio.

9 COMMISSIONER MacKEEN: I am talking about
10 cash ratios.

11 MR. CAMERON: Well, the cash ratio could
12 be varied between 8 and 12 per cent and the cash
13 ratio in a fractional reserve banking system
14 multiplies the effect of a change in reserve ratio
15 \$1 at 8 per cent by about 12 times in its impact
16 on the whole system. If they raised to 9, therefore
17 a rise of \$100 million in cash reserves can cause
18 a shrinkage in the total bank assets of \$1200 million
19 at 8 per cent and if the Central Bank has the right
20 to raise rates in stages from 8 per cent to 12 per
21 cent they can shrink the banking system most
22 unmercifully.

23 COMMISSIONER MacKEEN: The Central Bank
24 has the power to raise that to 12?

25 MR. CAMERON: Yes sir, in stages.

26 COMMISSIONER GIBSON: They have no power
27 to set liquidity ratios under the present Act.

28 MR. CAMERON: No, except in so far as they
29 can hold out as an alternative the threat of using
30 the cash reserve ratio.

COMMISSIONER GIBSON: Yes, but liquidity
ratios are not even mentioned in the Act, as I
recall it?

MR. CAMERON: They have no statutory basis.

1
2
3 COMMISSIONER MACKINTOSH: I was interested
4 in this section, Mr. Cameron, where you discuss
5 conflicts of interest and what you thought was the
6 wrong position of the Bank of Canada acting as it
7 were for itself on monetary policy and on the other
8 hand as fiscal agent for the government and agents
9 for various funds. As I see it, there is a basic
10 conflict here in that fiscal policy must on occasion
11 adjust itself to monetary policy and on other occasions
12 monetary policy must adjust itself to the exigencies
13 of fiscal policy.

14 I am uncertain whether these things can
15 be separated really. They are both dealing with the
16 same money market. I have a recollection in the
17 Radcliffe Committee Report where at one stage they
18 said that aside from the external problems the Bank
19 of England's debt management function comprised
20 all monetary policy, they had no scope for anything
21 else. To what degree do you think that having
22 the Department of Finance or some branch of it under-
23 taking to carry on debt management while the Bank of
24 Canada carried on monetary policy, to what degree
25 could these things really be separated or would you
26 have two sets of people acting, but only after they
27 had consulted? It seems to me neither could act
28 effectively without the knowledge of the other. I am
29 just puzzled as to whether these things could be
30 separated.

MR. CAMERON: I do not think they could be
separated in the final analysis, sir.

COMMISSIONER MACKINTOSH: Is there any
advantage in having two sets of agents?

1
2
3 MR. CAMERON: I think there is in that if
4 you have one body such as the United States Treasury
5 and another body such as the Federal Reserve Board
6 respectively charged with debt management and
7 monetary policy, if you go back to the years after
8 the war the Federal Reserve Board was completely
9 subordinated to the Treasury's desire to refinance
10 its debt on a cheap money basis. It was transformed
11 into a "involuntary engine of inflation" as someone
12 put it. This was dissolved about 1953 and since then
13 both bodies have threshed out their differences at
14 a higher level before they agreed on a compromise
15 policy which they thought satisfactorily served
16 both ends in so far as achieving the possible was
17 concerned.

18 Now, let us suppose that we might have had
19 the reverse procedure in this country: If we had
20 someone in the Finance Department and someone in the
21 Central Bank said: "Never mind the fiscal policy,
22 monetary policy is the be all and end all, we are
23 going to run this thing from the monetary policy
24 viewpoint", you would probably victimize the government's
25 debt management policy and force the government into
26 a position of building up a rather poor debt structure
27 and the Central Bank would in effect be dictating
28 the government's debt management.

29 COMMISSIONER MACKINTOSH: This is only if
30 the Central Bank could persuade the Minister of
Finance. They act on his instructions as fiscal
agent.

1 MR. CAMERON: Sometimes we may have
2 central bank governors who are extraordinarily
3 forceful or persuasive.

4 COMMISSIONER MACKINTOSH: I hope we would
5 have.

6 MR. CAMERON: Perhaps even domineering.
7 And we might have finance ministers who were,
8 shall we say, uninitiated in matters of finance
9 and who were on unfamiliar ground and perhaps
10 didn't understand the advice they are getting from
11 their own people in the department.

12 COMMISSIONER MACKINTOSH: I can follow
13 your argument that the Minister of Finance should
14 have advisors of acknowledged weight on fiscal
15 policy. I am not sure this necessarily goes as
16 far as separation of the agency of action.

17 MR. CAMERON: Well, the bank itself
18 could still be the agent handling the new issues,
19 but the determination of the character of the
20 issues might well be determined by the joint
21 views of some strong collection of advisors in
22 the finance department and the views of the bank.
23 It is my feeling that the views of the bank tended
24 to dominate both areas in recent years, and that
25 there was an unconscious flavouring of monetary
26 policy when those views are expressed to the
27 Finance Department, particularly to the Minister,
28 who perhaps could not recognize it too well.

29 COMMISSIONER GIBSON: Are you saying
30 the Bank of Canada may have tended to dominate the

1 Department of Finance in this respect, or that the
2 Department of Finance didn't have much of a debt
3 management policy?

4 MR. CAMERON: The finance department
5 during Dr. Clark's regime -- I think it was very
6 fortunate in having a man who was rather catholic
7 in his interests and a man of great force and per-
8 haps able to hold his own even with Mr. Towers if
9 there was anything upon which they didn't fully
10 agree. It has been my impression in recent years
11 that the people in charge of debt management had
12 a lot of other jobs to do at the same time; it
13 wasn't a full time responsibility; they didn't
14 have the research staff the Bank of Canada had,
15 and it was quite natural that the views of the
16 bank would tend to prevail in the absence of
17 evidence that some other policy should be followed.

18 THE CHAIRMAN: The United States
19 Treasury has a very large debt management depart-
20 ment which does its own research. It carries on
21 conversations with bankers and investment dealers
22 and decides what it would like to do itself before
23 they get around to checking with the Federal Re-
24 serve as to what the Fed. thinks ought to be done.
25 In that way there is a compromise thrashed out on
26 a more equal footing than exists in this country.

27 COMMISSIONER GIBSON: You think it is
28 an unequal footing rather than just leaving it to
29 a large extent to the central bank to do these
30 things. My impression is that the Department of

1 Finance has not had what you would call a debt
2 management department at all. They had a man
3 who spent a very large part of his time on it
4 who died about two or three years ago, and I
5 don't think they have had a developed debt manage-
6 ment department; am I correct in that?

7 MR. CAMERON: I think you are absolutely
8 correct.

9 COMMISSIONER GIBSON: Maybe the problem
10 is not so much the Bank of Canada foisted their
11 views or authority as them not having an active
12 and continuous view; is that a fair statement?

13 MR. CAMERON: I think it is fair to say
14 they may have moved into banking to begin with
15 and perhaps afterwards found it was easier to let
16 things go on this way.

17 COMMISSIONER BROWN: Has this arisen in
18 part because of the conflict between the Bank of
19 Canada and the department, and has it been resolved
20 because of a clearer laid down responsibility --
21 in other words, is it clear the Bank of Canada is
22 carrying out the policies of the government both
23 in the monetary field and debt management?

24 MR. CAMERON: Yes, the government should
25 have a clear view in the finance department as to
26 what debt management policy would be the best from
27 the standpoint as a borrower.

28 COMMISSIONER BROWN: It seems to me these
29 all have to be melded together.

30 MR. CAMERON: They do eventually.

1 COMMISSIONER BROWN: The monetary policy
2 and debt management, to produce the end result?

3 MR. CAMERON: They do eventually.

4 COMMISSIONER GIBSON: The classic example
5 of trouble in this area is where the treasury is
6 always over-ruling the central bank. In this
7 case you are complaining about the other thing,
8 and usually one expects a central bank to have a
9 somewhat longer view and, therefore, perhaps a
10 somewhat better view from the broad national
11 point of view on these matters, because they are
12 not subject to the ordinary pressures?

13 MR. CAMERON: I would like to cite the
14 conversion loan as an example, particularly since
15 events in recent months indicate that the govern-
16 ment has reversed its view of 1958 that the debt
17 had to be extended, and it has been engaged in
18 buying in and cancelling the long term debt. If
19 the conversion loan is a creature of the bank, I
20 think a proper debt management division in the
21 finance department might warn the Minister more
22 strongly as to the long term effects of it. If
23 the loan is the creature of the finance department,
24 the bank obviously did not warn them very strongly
25 that within four years they would be trying to
26 shorten their debt by paying in long funds, with
27 money borrowed on the short end of the market.
28 So, I am led to the belief this was the bank's
29 creature and that the department, with such a
30 debt management commission as I have in mind, might

1 have rejected this idea and only bought it in
2 modified form.

3 COMMISSIONER GIBSON: You say a great
4 deal -- not a great deal, but quite a bit about the
5 conversion loan in your brief: Is it your view
6 that the conversion operation at that time was a
7 bad thing, or is your objection basically to the
8 way this has happened?

9 MR. CAMERON: I think the concept of it
10 had something in its favour, but I think it was
11 pursued too far, and badly handled.

12 COMMISSIONER MACKINTOSH: When you say
13 it was pursued too far, you mean it was too large
14 a scheme?

15 MR. CAMERON: It was too large and too
16 comprehensive a scheme.

17 COMMISSIONER MACKINTOSH: It was too
18 big a bite?

19 MR. CAMERON: And I think it may have
20 gone too far in the direction of dealing with
21 issues that were eight years removed from maturity.
22 I have^a/reference in here to statements to the
23 effect that the market regarded these bonds as
24 due on their call dates, principally the 1963 and
25 1966 maturities, which were callable in 1961.
26 This is a rather ridiculous statement when you
27 consider that the 1966 maturity was selling at
28 over five points discount.

29 COMMISSIONER BROWN: You mentioned dis-
30 agreement: Are you under the impression it might

1 have worked more smoothly if the market had moved
2 up and exchanges had taken place at current
3 quotations?

4 MR. CAMERON: I think that would have
5 been a much more ^{honest} way of doing it -- saying, "Here
6 is a new bond. You can have it in trade for your
7 1966 if you like, or, if you don't like, you can
8 keep your old bond. We are not putting any cash
9 price either on the new bond or on the old one and
10 we will let the market determine whether the
11 rights value attached to this exchange will be
12 placed on the value of the old bond or what the
13 market is willing to pay for the new bond." You
14 will recall that the old bond was selling at
15 about 94 and a half the day before the loan was
16 announced, and it was worth par the next day;
17 not through any active market, but because the
18 marketing committee and the bank decided that
19 was the appropriate value.

20 COMMISSIONER MACKINTOSH: Had they
21 not acted, would not the market have lifted that
22 bond to par?

23 MR. CAMERON: I would doubt it. I
24 think your equilibrium point might be some place
25 between the old value of 94 and a half and par.
26 That is a matter of opinion. The fact remains
27 they had to buy back a lot of their own merchan-
28 dise at the prices they put, to wit, par, on the
29 longer Victory bond in 1966, indicating that
30 there was a body of individuals who preferred cash

1 to the new bond at that price. I don't know what
2 the price would have been, but it would have been a
3 free market price.

4 COMMISSIONER MACKINTOSH: As I read
5 financial history, all the respectable people
6 seem to have been in favour of funding, though
7 not many people have done that in recent years;
8 but you think, within reasonable measure and
9 properly handled to extend the term of the debt
10 may be all right, is that it?

11 MR. CAMERON: Yes, I think so, as a
12 matter of general principle, sir.

13 COMMISSIONER MACKINTOSH: Was there
14 not some fortuitous circumstance -- I forget the
15 details; the United States' rates moved rather
16 sharply, did they not, before this operation was
17 over?

18 MR. CAMERON: They had already started
19 to move rather sharply before the operations
20 commenced also. The United States market reached
21 a high point, if I remember correctly, late in
22 April 1958, and certain reasonably long term bonds
23 had already moved off in the order of three or
24 four points by the time the conversion loan was
25 announced, and on top of that the banks, I think,
26 were really tempting the lightning when they
27 assumed in the face of an already obvious trend in
28 the American market that they could freeze -- in
29 effect, close up -- the free bond market of
30 Canada for 60 days and expect that they would put

1 this operation across without any repercussions.
2 I would suggest this is an error of judgment.

3 COMMISSIONER MACKINTOSH: It may have
4 been originally that the Minister judged that the
5 mark-up in rates that was inherent in the con-
6 version would have allowed him sufficient freedom
7 for monetary restraints, but that in the event he
8 did not have any leeway --

9 MR. CAMERON: If he had forgotten cash
10 price and merely announced a bond for bond exchange
11 he need not have cared what happened in the
12 American market or to our market. He was offering
13 the bond at one and a half per cent more interest --
14 never mind the relative ---

15 COMMISSIONER MACKINTOSH: On the inter-
16 vention of the Bank of Canada into the bond market
17 in any of its various functions, my understanding
18 is that it has always known whether the bank is
19 acting as principal or agent.

20 MR. CAMERON: They generally will tell
21 you if they do^a/deal that they are acting for an
22 account, or, if they don't tell you they are acting
23 on their own. This gets back into the question of
24 the use of trust funds, perhaps, because if the
25 bank has discretionary power over the use of
26 extraneous accounts, it can pursue policies de-
27 signed to affect the level of the market using, in
28 effect, somebody else's money.

29 COMMISSIONER MACKINTOSH: You think they
30 are not just carrying out operations necessary to

1 raise funds, but are using the funds for monetary
2 purposes?

3 MR. CAMERON: Or for debt management
4 purposes.

5 COMMISSIONER MACKINTOSH: Or for debt
6 management purposes?

7 MR. CAMERON: Yes. I think the use
8 of the Unemployment Insurance Fund in the summer
9 of 1958 is a case in point.

10 COMMISSIONER MACKINTOSH: Well, of course,
11 one of the difficulties earlier was in the fund
12 holding long term bonds.

13 MR. CAMERON: It held a balance, I
14 believe, in the order of \$80 million or \$90 million
15 in 1959 and 1960 -- maturity as well as the bonds
16 -- and during the conversion loan these were ex-
17 changed for conversion bonds even though an
18 examination of the seasonal pattern of the fund,
19 even in a normal year, let alone the year in
20 which there was still substantial unemployment,
21 this pattern would show that the fund would have
22 to liquidate some securities by fall, and yet the
23 fund was permitted to denude itself of its most
24 liquid assets. As I recall it, it had hardly any
25 treasury bills at that time. Also its 1959 and
26 1960 maturities were its most liquid assets -- the
27 two next due Victory Bonds.

28 COMMISSIONER LEMAN: Mr. Cameron, we
29 had a witness a few days ago who put in a whole
30 brief to prove to us the conversion loan had an

1 effect of raising Canadian interest rates -- the
2 whole pattern of Canadian interest rates quite a
3 bit above the normal pattern of difference with
4 the United States rate; do you think it had that
5 effect?

6 MR. CAMERON: I think basically it did
7 have that effect.

8 COMMISSIONER LEMAN: Do you think in that
9 sense perhaps it was part of monetary policy?

10 MR. CAMERON: I am sure the whole thing,
11 if you regard it as a conception of banking
12 rather than the financing part of it, was monetary
13 policy pure and simple, and that debt management
14 was sort of dragged in like the cat as the excuse.

1
2
3 I believe it had dawned on certain people
4 in the month of June that the recession was over,
5 and that a lot of money had been pumped into the
6 system, and that we were facing a record deficit
7 which would cause the creation of a great deal more
8 money in all probability, and that such a deficit
9 may not have been appropriate with a recovery and
some means ought to be found to offset that deficit.

10 One way you could do it was to have a tight
11 money policy, but the difficulty in having a tight
12 money policy, if you have a lot of liquid assets
13 in the hands of the public, is that they can cash
14 them in at maturity, if they are short-term assets
15 sell them at minimal losses. Therefore it would
16 be a good idea if we could find an excuse to cause
17 the public to surrender these short-dated assets
18 for longer-dated securities, so that when we get
19 our tight money policy they will sell at substantial
20 losses and many people would have occasion to
21 liquidate, and that the loan essentially was a
22 scheme to take away the 1959 and 1960 and possibly
23 the 1962 maturities which were to some degree still
24 held by the original purchase, and to make the
thing jell is a Victory Loan conversion scheme,
and '63 and '66 down were added as an after-thought.

25 COMMISSIONER LEMAN: Mr. Chairman, in your
26 brief you make the point quite a few times that if
27 the Bank of Canada in exercising these powers for
28 monetary policy ojectively, would stick to the
29 short-term instruments, that arbitrage would take
30 care of the differences to establish the appropriate
rate curve from shorts to longs. Do you think that

1
2
3 arbitrage actually does adjust properly? I think
4 you have just explained to us that influence in
5 long-term areas can be quite a weapon for monetary
6 policy.

7 MR. CAMERON: I would hope it is never
8 used in that manner again, because I think it has
9 been responsible for causing the atrophied position
10 of the monetary market most of the time since,
11 and at the same time creating, for lack of a better
12 word, I will call it a "shock" to government credit
13 and produce a higher level of interest rates than
14 would otherwise have been pursued.

15 COMMISSIONER LEMAN: I think we are trying
16 to distinguish here between the objective and the way
17 it was done. Let us not get back again into certain
18 mistakes that have been made and the way it was
19 handled and all the accessory things that you object
20 to, but as an objective, if the monetary authority
21 all of a sudden finds that the rate curve has gone
22 wrong, why would it not take interest in trying
23 to rectify it?

24 MR. CAMERON: Because I do not believe there
25 is any man alive who has the second sight or
26 perspicacity to decide what is a proper yield curve
27 throughout the whole spectrum of instruments.

28 COMMISSIONER LEMAN: Well, perhaps not in
29 the absolute, but certainly we talk about perverse
30 ways in which a certain kind of action reacts
sometimes and you do meet in their connection to an
interest rate curve in the U.S.A., for instance, and
that of Canada. Surely without being too absolute
about it, you can determine if you have got a rate

1
2
3 curve that is wrong, can't you?

4 MR. CAMERON: Well, with the free access
5 to our market which the funds have, plus the
6 substitutability of one asset for another that
7 our institutions have, I would think that this
8 thing would iron itself out with the passage of time,
9 at least as well as any person, to form a judgment
10 that this, that or the other relationship was wrong,
11 because you would have the decision made by a
12 thousand investors that it was wrong, and that would
13 be something about it for the condition that would
14 prevail, and would reflect the judgment of the market
15 at large.

16 COMMISSIONER GIBSON: Carrying this argument
17 a little further this is really the "bills only"

18 argument or the short-term end only for a smooth,
19 bank, open market operation, apart from the
20 question of the rate term, whether or not anybody
21 can have a sensible view of what it ought to be
22 at a given time, and at any given time the government
23 has so much weekly assets coming up.

24 Now, recently there has been a lot coming
25 up, and here you run into the question of debt
26 management and monetary policy, and they are so
27 closely interwoven that, as Dr. Mackintosh was
28 suggesting earlier, it seems awfully difficult to
29 view it as anything but one inter-related set of
30 problems.

Can you in fact take the position, in view
of the maturities coming up one after the other,
that a Central Bank should confine itself to bills
only or very short-term Governments in its open

1
2
3 market operations.

4 MR. CAMERON: I think they would have a
5 much better market if they restricted their own
6 activities to bills and, shall we say, money market
7 securities, in other words maturities under three
8 years.

9 COMMISSIONER GIBSON: Up to three years.

10 MR. CAMERON: This is the area in which the
11 market is broadest and in which they can effect the
12 necessary adjustments in a chartered bank cash reserves
13 with the minimum impact on price.

14 There are two reasons for this. One is that
15 the market is broad and the other is the mathematical
16 one, that a change in yield has a most minimal effect
17 on capital values the shorter the term of the instrument.

18 COMMISSIONER GIBSON: This has not been the
19 Canadian practice, nor has it been the British practice,
20 as I understand it. It is closer to being American.

21 MR. CAMERON: And the Dutch practice.

22 COMMISSIONER GIBSON: Why should the Central
23 Bank draw off the right to intervene in the medium
24 and longer term? This might be a good reason for it.

25 MR. CAMERON: I think their intervention has
26 done a good deal over the years to cause the market
27 to be regarded as a good place to stay away from,
28 because they are likely to intervene in one side
29 or the other, and the more they intervene the more
30 they produce the fictitious level of prices --
fictitious in the sense that they themselves have
been the greatest force contributing, with a secondary
following of people looking for capital gains.

1
2
3 I will go along and "play with the house",
4 if I can put it that way, and then when the bank
5 reverses itself, steps out of the market, the secondary
6 following deserts the market also. They can fool
7 themselves as to the level of the market of which
8 they are the principal creator.

9 COMMISSIONER GIBSON: You are arguing that
10 the net effect of this is a higher long-term structure
11 of interest than they otherwise meant to have.

12 MR. CAMERON: In a market which does not
13 provide a proper indication to the government as
14 to where it can raise money. If we wanted to reduce
15 it to mining stock terms, if the promoter has made
16 a market in a mining stock both sides of the market
17 and he has produced a situation where only the most
18 gullible would assume that that level would prevail
19 once the promoter stepped out of the market.

20 COMMISSIONER GIBSON: I don't know whether
21 this is an altogether appropriate analogy.

22 MR. CAMERON: I am trying to paint a broad
23 brush.

24 COMMISSIONER GIBSON: Suppose the Central
25 Bank went to a short-term Canada instruments only
26 policy, do you think that the medium and longer
27 term market would develop in a smooth kind of way,
28 or would you have a period when prices were pretty
29 erratic.

30 MR. CAMERON: Speaking personally as a
jobber, I think our activities in the market would
expand. We would be more willing to take positions
based on our judgment as to what was value, long
or short, knowing that the other forces in the market

1
2
3 consisted of other dealers, institutions and the
4 chartered banks who were operating and forming
5 judgments on the basis of roughly the same facts
6 that we can see. I think the market would broaden.

7 In the early 1930's there was no Central
8 Bank, and although you had a market that had wider
9 spreads between bid and asked, it was possible to
10 trade blocks of a quarter or half a million dollars
11 worth of long-term Governments without a Central
12 Bank. In terms of today's debt, this would be
13 the equivalent of talking of bundles around five
to six times as large.

14 COMMISSIONER GIBSON: That is what I am
15 wondering -- some of the big bundles that would be
16 tossed out on the market, and Central Bank pay no
17 attention, that you might not get some quite
18 substantial variations in price, however erratic,
not necessarily meaningful in character.

19 I think you would find more institutions
20 willing to arbitrage if a bundle of bonds was thrown
21 on the market at an unduly cheap price; there would
22 be a number of people willing to work them off in
23 exchange for some other Government which they thought
24 was now slightly high priced by comparison, so that
25 the impact of that one bundle would be diffused
26 throughout the range of other long-term bonds, or
27 you might encourage people to liquidate shorter
issues and buy them.

28 COMMISSIONER GIBSON: One other question
29 on this "pool bills only" approach. Suppose, to
30 maintain investment boom in the economy of the kind
we had from 1954 to 1957, early 1957, in those

1
2
3 circumstances -- and certainly with the benefit
4 of hind-sight one can see that the rise in the long-
5 term rate of interest was a desirable phenomenon
6 from the standpoint of cyclical economic policy, if
7 you stick to "bills only" this has got to gradually
8 work its way through. If you can buy and sell longer
9 bonds, Central Bank is in the position directly of
10 endeavouring to change longer-term rate of interest,
11 and in some circumstances I suggest this might be
12 the right kind of policy.

13 MR. CAMERON: In one of those years the
14 Governor is on record ---

15 COMMISSIONER GIBSON: I am not talking
16 about what the bank can do.

17 MR. CAMERON: --- as saying that the rates
18 would have risen further had they not intervened.

19 COMMISSIONER GIBSON: I realize that there
20 was a certain difference of view at this time, but
21 what I am asking is , would there be merit in the
22 policy which was designed to raise long-term interest
23 rates in those years rather than to lessen the rise.

24 MR. CAMERON: I think there would have been,
25 but the bank chose otherwise.

26 COMMISSIONER GIBSON: That is right.

27 MR. CAMERON: To minimize the rise in rates,
28 and furthermore I think it was the spring of 1956 or
29 1957 when at a time of general restraint they told
30 the banks that they could lend an extra \$200 million,
I think the amount of money was, mortgages and that
the bank would furnish the necessary reserves.

COMMISSIONER GIBSON: I think that mortgage
problem is in 1955, and the really tight situation

1
2
3 in 1955, and the really tight situation came in
4 1956, did it not?

5 MR. CAMERON: I think it was the spring of
6 1956.

7 COMMISSIONER GIBSON: Late 1956, early 1957.
8 Well, would you admit there were circumstances in
9 which it might be desirable for the Central Bank
10 to work directly on the long-term rate of interest?
11 This is my basic question.

12 MR. CAMERON: I am afraid I do not, sir,
13 after seeing them operating in the long-term rate
14 of interest over the last few years.

15 COMMISSIONER MACKINTOSH: Mr. Cameron, this
16 is getting down very close to saying that they are
17 such inept operators that the fewer places they operate
18 in the better. It is not very helpful as a guide to
19 policy.

20 MR. CAMERON: Well, if you are the largest
21 bull in the china shop, the smaller the area of the shop
22 you are confined in the better. I believe the concept
23 of many central banks is that their prime function is
24 to bury the reserves in the banking system and let
25 the chips fall where they may in the interest rate
26 structure.

27 COMMISSIONER MACKINTOSH: As a supplementary
28 question, does the United States Treasury operate in
29 the bond market?

30 MR. CAMERON: They invest money for trust
funds in the bond market.

COMMISSIONER MACKINTOSH: They do not operate --

MR. CAMERON: On one occasion after a
disorderly market in May of 1958 in which speculators

1
2
3 bought a large amount of an issue that subsequently
4 went to a discount, the Treasury did buy in a portion
5 of the issue and cancel it. The Federal Reserve
6 since the spring of 1951 had been operating beyond
7 the short range, although, as you can see from the
8 testimony of Mr. Martin later in my brief, he is
9 beginning to wonder if he had not over-done it.

10 COMMISSIONER GIBSON: Did I understand you
11 to suggest that during the years 1954-1957 that
12 if the Bank of Canada had not intervened at all in
13 the long-term market, the natural forces would likely
14 have resulted in raising the interest rate?

15 MR. CAMERON: Yes sir. I forget the exact
16 words of the Governor's report, but it was to the
17 effect that the rise in the long-term interest rate
18 which had taken place would probably have gone much
19 further left to its own devices. I believe Mr. Hampson
20 recalls the year. 1956.

1 COMMISSIONER GIBSON: I have a very
2 general question I would like to raise with you,
3 Mr. Cameron. Throughout your entire presentation
4 there is a general atmosphere to the effect that
5 you do not really trust the monetary authorities
6 too much certainly not governments too much. Mr.
7 Mackintosh was just referring to this. You imply -
8 in fact you say quite directly that we are in a
9 long term period of debasement of our currency in
10 fact and that you are very concerned about this
11 and this matter seems to direct a lot of your
12 thinking or at least affect your thinking on a
13 good many of these matters. Now, I would like
14 to ask you if you can give a reasonably brief
15 sort of answer, what you think the medium and
16 longer term outlook from the standpoint of in-
17 flation is. In the process you could tell us
18 whether or not you thought this was something
19 that could be changed or if it is an underlying
20 trend that seems rather deeply embedded. I would
21 like to hear what you have to say about whether
22 changes in the general economic environment are
23 improving or making this problem worse?

24 MR. CAMERON: I have submitted, sir,
25 some supplemental thoughts along this line which
26 I would like to summarize if I may. Mr. Hampson
27 has a copy and I have three or four more which
28 could be passed around.

29 Basically, if you read economics history,
30 currency debasement has gone on, I think, since

1 currency was invented. There was one exception to
2 this general rule. From the first quarter of the
3 last century until possibly the war of 1914 when
4 currency tended overall to hold back prices
5 fluctuated to perhaps not more than 30 per cent
6 in any one direction and then tended to correct
7 themselves and go back to where they had been.

8 At the same time, people who bought
9 British government securities found there was a
10 gradual raise in prices and it is in this area
11 that the British Financial Institutions, as we
12 know them today, started to grow and I think our
13 system grew in the same image. Popularly, this is
14 associated with the gold standard. England really
15 did not have much gold and I think it was the
16 stability of the pound sterling that made the
17 gold standard work. Since then we have had two
18 world wars which completely destroyed a number of
19 currencies and partially destroyed others. We
20 in North America have been most fortunate in that
21 the destruction of the value of money since the
22 start of the last war has not varied more than
23 50 per cent. But we now have governments spending
24 a quarter or more of the gross national product and
25 dedicated to the idea that they can maintain full
26 employment by a counter-cyclical fiscal policy with
27 monetary policy to aid and abet this.

28 So that the counter-cyclical deficit is
29 easily excused because we are in a period of re-
30 cession and rising unemployment. Nobody ever wants

1 to get around to a counter-cyclical surplus. It is
2 just human nature.

3 COMMISSIONER MACKINTOSH: Well, there were
4 quite a few years of surplus.

5 MR. CAMERON: I think those were rather
6 inadvertent also in that they stemmed from rises
7 in price.

8 COMMISSIONER MACKINTOSH: Deficits were
9 inadvertent too.

10 MR. CAMERON: There is something rather
11 imperfect in the financing of deficits by monetary
12 expansion. In practice the government gets a lot
13 of new money which has been created and spends it.
14 As it gets into the hands of the public some of
15 them spend it in areas where there is slack in
16 the economy and it does some positive good in that
17 it reactivates idle labour and capacity. Others
18 try and spend it in areas where there is not any
19 slack and this enables the people in that area
20 to raise their prices and wages successfully.
21 Some spend their new money on foreign goods because
22 our goods are not competitive and this creates
23 balance of payment problems. Some will buy goods
24 that used to go for export and this also has its
25 effect on the balance of payments.

26 We finally reach a point perhaps where
27 to keep the economy going at the rate which we have
28 attained we are going to need some more money added
29 to the system to finance the areas where price and
30 wages have risen. So we get people saying we need

1 more money supply because the economy is slack and
2 then later on we need more money supply because
3 the economy is operating at a higher level than
4 before and if somebody puts the brakes on then
5 the fellows who have priced themselves out of
6 consumer markets start to have slack capacity and
7 unemployment again.

8 I think that this situation has been
9 with us since about 1946 in spasms and has the
10 effect of causing prices to rise during a boom
11 and stops them falling during a recession and
12 acts as a sort of ratchet on the price structure.
13 This is done in public consciousness and you have
14 people altering their financial behaviours so
15 that such money as they do save is finding other
16 outlets to that which it did under the old
17 assumption of stable money.

18 For instance, our life insurance com-
19 panies and saving bank deposits have grown much
20 more slowly than the gross national product. If
21 you take the gross national product since 1946,
22 last year, it ran to 306 per cent of the 1946
23 level but your savings deposits in banks was only
24 239 per cent of the 1946 level. Your 12 largest
25 life companies were only 246 per cent in assets
26 above the 1946 level. The largest company presents
27 a rather complete financial statement which, among
28 other things, shows that dividing the business in
29 force into the premium income it reveals that the
30 average premium has gone down from \$42.70 to \$23.41

1 which would indicate to me that people are not
2 using life insurance for savings in the way they
3 used to but rather are buying fire insurance on
4 their lives and putting their money into mutual
5 funds or things of that sort.

6 I think this is creating a strong
7 diminution in our institutions which lend money
8 and normal savings relative to the G.N.P. If we
9 carry this on long enough and couple it with an
10 increased willingness to borrow money on the part
11 of people, municipalities and others because they
12 hope to pay it back in cheaper dollars, we are
13 going to fasten a high scale of interest rates on
14 ourselves.

15 I am afraid this is a way of life. It
16 is one of the weaknesses in democratic government
17 which inadvertently adopts these policies in catering
18 to the desires of the voters for "pie in the sky"
19 or guaranteed full employment or whatever you
20 want to call it.

21 COMMISSIONER LEMAN: Is there anything
22 we can do about this?

23 MR. CAMERON: We can learn to live with
24 it.

25 COMMISSIONER GIBSON: Don't we learn any-
26 thing, though, from our experience? Look at what
27 some of the European countries have done. They
28 had a highly inflationary situation in most cases
29 up until six or seven years ago. Most of these
30 countries have taken their affairs in hand and

1 gotten them in reasonable shape. Great Britain
2 has been through two tight money situations and
3 now, in an effort to improve their basic economic
4 affairs she is talking about taking a very long
5 and difficult step and going into the European
6 common market.

7 In the States you point to their policy
8 in the last few years. They have shown some
9 reasonable measure of restraint under considerable
10 political pressure. I just cite these things to
11 you to show that it is perhaps not quite hopeless.

12 MR. CAMERON: No, it is not hopeless
13 and in the European countries either, their
14 currencies go right down, not once but twice.

15 COMMISSIONER GIBSON: The British did
16 not.

17 MR. CAMERON: In the case of the French
18 franc we would be as well off with the 1870 French
19 franc as the United States would be with Confederate
20 money. They learned the hard way. The British
21 did not quite have to learn the hard way because
22 they would probably have been on the brink of
23 starvation if their currency had gone any lower.
24 I think the United States has now realized that
25 it must put its internal housekeeping in order;
26 otherwise, its reserve of gold may be drawn away
27 from it and the dollar may have to be debased.

28 COMMISSIONER GIBSON: But they are facing
29 the problem.

30 MR. CAMERON: I think they realize the

1 problem. I am not quite sure whether we in Canada
2 have not been living in a bit of fool's paradise
3 during the last 15 years. I won't use the phrase
4 living beyond our means but maybe we need a shock.

5 . COMMISSIONER BROWN: Would the pressures
6 of a free exchange rate bring this about?

7 MR. CAMERON: The pressures of a free
8 exchange rate unfortunately can be altered by
9 monetary policy. I think perhaps the exchange
10 rate has been the make-way for all the other things
11 we wanted to do. For instance, in making money
12 unduly tight several years ago we created situ-
13 ations which drove borrowers into the United
14 States markets who brought back United States
15 funds in even greater volume than we needed to
16 cover our balance of payments deficit at whatever
17 was the equilibrium level and the surplus United
18 States funds drove the price of the American
19 dollar down to the point where imports were
20 attracted into this country which would not have
21 come in at the higher rate for the United States
22 dollar.

23 Now, we have reversed ourselves and we
24 are going the other way. If we made money too
25 easy in this country I am sure that our exchange
26 reserves would disappear if we tried to hold the
27 rate or that our dollar would to a most significant
28 discount if we raised the rate and this would raise
29 the cost of living. This would be a cut in real
30 wages. This would probably restore our competitive

1 position except that those who save money would
2 lose a good portion of the value of their savings
3 if the prices went up.

4 Another way to get on the track is by
5 cutting money wages but that is politically un-
6 palatable and would visit great suffering on those
7 who are heavily in debt.

8 I think the mills of the gods are grinding
9 in the direction of teaching us a lesson but whether
10 it be in the form of depleting exchange reserves
11 or diminishing value for our dollar or a rise in
12 domestic prices or a combination of all three at
13 different times I don't know but I think if we
14 continue to run deficits in the order of three-
15 quarters of a million when we are supposed to have
16 a seven per cent increase in G.N.P. this year that
17 we are in for some trouble.

18 COMMISSIONER GIBSON: Looking ahead in
19 the usual western world environment, the environ-
20 ment in which we live, what do you see -- gradual
21 increase in the world price level, a relatively
22 stable world price level or what?

23 MR. CAMERON: I think commodities might
24 even get cheaper, sir.

25 COMMISSIONER GIBSON: You are not con-
26 cerned about the world inflationary environment
27 for the time being?

28 MR. CAMERON: Not particularly. I think
29 that we are more prone to inflationary pressures
30 here than perhaps the Americans and perhaps the

1 Europeans in general notwithstanding what is going
2 on in Germany at the moment because I think they
3 have shown in the past the will to correct things.

4 COMMISSIONER GIBSON: You would not go
5 along with this idea that there is a permanent
6 tendency for prices to go up two or three per
7 cent per annum over a long period?

8 MR. CAMERON: Services perhaps and manu-
9 factured goods prices with higher labour content
10 but we seem to be getting into an area of over-
11 production of basic commodities which would tend
12 to hold prices stable or bring them downwards and
13 that is all the more reason for us to keep our
14 own costs in line because we ourselves are
15 producers of some of these basic commodities for
16 the world markets.

17 THE CHAIRMAN: Have you any special
18 views in relation to sales of securities regula-
19 tions, whether or not it would be desirable to
20 have a securities commission or an S.E.C. in
21 Canada so that there would be uniform regulations
22 throughout the country?

23 MR. CAMERON: Just rather general ones,
24 sir. I do not deal in corporate securities but
25 there are some things that I think are desiderata
26 in this country and that they could be more easily
27 attained under one set of laws instead of ten
28 jurisdictions enforcing, what the Saskatchewan
29 commissioner says is 25 different sets of laws.

30 In the past there have been cases of

1 unscrupulous operators who get ruled off the course
2 in one province setting up shop somewhere else and
3 doing damage before they could be brought to book.
4 I would think that if there was a federal juris-
5 diction one false step and they would be through.

6 Another thing that appeals to me about
7 what the Americans do is take steps to prevent
8 directors and officers of companies from taking
9 undue advantage of inside information purely by
10 compelling them to publicize transactions in shares
11 of the companies in which they are interested.
12 Since stock exchanges operate under four different
13 jurisdictions it might be better if there were one
14 law governing them all so that no one in any one
15 province would be any less subject to such re-
16 quirements.

17 Another thing that the Americans have
18 done with their S.E.C. regulations is compel the
19 production of most voluminous prospectuses with a
20 great^{deal}/more information than is the case in this
21 country. I suppose some people do not read them
22 but the information is there. I think that could
23 be better done under one jurisdiction; otherwise,
24 you would find people filing their prospectuses
25 in the most easy-going manner to provide the
26 minimum of information.

27 One other thing, I think stock exchanges
28 have got to be a place where a buyer and seller
29 meet on an even basis in a really free market. One
30 of the rules in the United States was that stock

1 exchanges were not places to be used where distri-
2 bution of treasury stock takes place because this
3 sets up a situation where there is profit to be
4 made in distributing treasury stock. It is true
5 that the public ought to be able to tell from
6 looking at the quotations that a company is dis-
7 tributing treasury stock but they do not. There
8 again, if that were deemed desirable I think it
9 would be better that there was one jurisdiction
10 rather than some saying you can do it in one pro-
11 vince and others saying you cannot in the next
12 province.

13 I don't know whether this comes under
14 the property and civil rights --
15 .

1
2
3 THE CHAIRMAN: There may be some question
4 about that, but we are interested. We have had a
5 number of witnesses before us who have discussed
6 this problem and we thought perhaps you would have
7 some useful views on it. It may be there are
8 constitutional difficulties, but nevertheless it
9 is a problem.

10 MR. CAMERON: There may be the trade and
11 commerce definition.

12 THE CHAIRMAN: I don't know we need to
13 figure out what it means or what would have to be
14 used to accomplish the purpose; but the question
15 as to whether it would be desirable is a question
16 which, I think, is relevant to our inquiry.

17 MR. CAMERON: I think it would be basically
18 desirable.

19 COMMISSIONER MACKINTOSH: The London
20 Stock Exchange provides for primary distribution,
21 doesn't it?

22 MR. CAMERON: I am not sure, sir.

23 THE CHAIRMAN: Is there much primary
24 distribution on the Toronto Stock Exchange now?

25 MR. CAMERON: I believe there is in the
26 field of mining and oil shares; additional options
27 were granted to promoters.

28 COMMISSIONER LEMAN: I would like to ask
29 one more general question: To what extent do you
30 believe that monetary policy can be effective in
Canada in our circumstances for the objectives
that you, at least, seem to recognize in your brief?
In a way you seem to suggest some amendments to
the way the Bank of Canada should act which, to me,

1
2
3 indicate it may weaken a little bit their powers
4 of control, and even with their present powers of
5 control -- assuming, of course, the objective is
6 not wrong in the mind of the Governor at the time
7 he adopts the policy.

8 MR. CAMERON: Your question is basically,
9 do I think monetary policy will work in Canada?

10 COMMISSIONER LEMAN: Yes.

11 MR. CAMERON: I think that monetary policy
12 in Canada can only work to a rather limited degree
13 should it be in conflict with the monetary policy
14 of the United States. Commerce and money have a
15 common propensity to find their own levels in that
16 the American -- well, I think Mr. Towers' expression
17 was, that a few splashes of water to the Americans
18 could be a flood here. I think this works to this
19 day also.

20 COMMISSIONER LEMAN: Would this argue for
21 having more power of control in Canada; in other
22 words, where you are more exposed you need more violent
23 action?

24 MR. CAMERON: I think if we take any violent
25 action to insulate ourselves against some particular
26 happening in the United States that we will probably
27 build up in some other area a counter-pressure as
28 a result of our divergence from their policy. Let
29 me put it this way: If our money rates diverge too
30 far from those of the United States you begin to set
up exchange flows, and if they attain a large magnitude
you are going to have a change in the exchange rate
and a change in the propensity to export or import.
If you had a fixed exchange rate and a divergence of

1
2
3 interest rates and a wide degree between here and
4 the United States, you would have the government in
5 the position of having to run its exchange reserves
6 down in maintaining the fixed rate, or being on the
7 receiving end, as you were in 1950, of great gobs
8 of money which the government would have to find
9 the wherewithal to finance. I don't think there is
10 any way you can get away from the influence of
11 United States monetary policy to any material degree
12 without setting up an embarrassing force in some other
13 area.

13 COMMISSIONER LEMAN: You mean we have to
14 trust they will adopt the right policies?

15 MR. CAMERON: I am afraid that we are not
16 exactly the thirteenth federal reserve district, but
17 we are imperfectly insulated from the other twelve.

18 THE CHAIRMAN: Our policy would necessarily
19 have to be conditioned to their policy, and it may
20 not necessarily be exactly the same.

21 MR. CAMERON: With minor differences.

22 THE CHAIRMAN: With minor variations: You
23 see that as inevitable?

24 MR. CAMERON: Yes, sir. You have probably
25 had people suggesting a regional monetary policy
26 for Canada, and other people telling you this is
27 not very practical, as between the Pacific Coast,
28 the Maritimes and the Central provinces. Well, what
29 I am suggesting is that a regional monetary policy
30 for Canada alone is rather difficult when we have
so many agencies, especially borrowers and lenders,
having access to the United States market, and if we
set up barriers in one direction we get these forces

1
2
3 in the other direction. If we fiddle with our
4 interest rates we pay the price on the exchange rate,
5 and if we fiddle with our exchange rates we may pay
6 the price on the interest rates.

7 COMMISSIONER GIBSON: Mr. Towers once made
8 the statement that to combat inflation in this country,
9 it would be very difficult for us to do better than the
10 Americans; we would have to work fairly hard to do
11 as well, and we could easily do worse: Do you agree
12 with that view?

13 MR. CAMERON: I would agree with that
14 completely.

15 COMMISSIONER BROWN: In connection with the
16 money market you suggested that the present restrictive
17 money market could be changed and that the money
18 market should be thrown open to all dealers who wish
19 to participate on the basis of the margin requirements
20 suitable for the particular piece of paper they wished
21 to deal in: Would you like to expand on this a little
22 as to what extent you think this might make the
23 Bank of Canada's position a little more difficult
24 or possibly easier?

25 MR. CAMERON: At the moment you have a
26 restricted number of dealers enjoying the privilege
27 of membership in the money market which includes,
28 first of all, the privilege of borrowing against
29 certain collateral at special day-to-day rates at
30 the chartered banks, and in the event that supply
of money dries up that they have recourse to the Bank
of Canada bank rate. Other dealers against the same
collateral may not enjoy the privilege of day-to-day
loans from the chartered banks nor the accommodation

1
2
3 at the Bank of Canada. In return for this privilege
4 dealers who are members of the official money market
5 find the Bank of Canada displaying a fatherly interest
6 in what their portfolio contains, which must be
7 Canadas under three-year term -- including Treasury
8 bills, and I suspect there are some members of the
9 money market who make good money out of their dealings
10 in these securities, and there may be others who
11 stay in the game not because they are making any
12 money out of it but because there is a certain
13 prestige attached to it. If the thing were thrown
14 open to everybody I think there may be some of these
15 who are staying in for prestige reasons who might
16 do a good deal less, and that the main volume of
17 the market would probably get into the hands of
18 four or five principal operators, such as the English
19 Discount Market is in the hands of approximately
20 a dozen, but that the other dealers enjoying equal
21 privileges as and when they chose to exercise them
22 would exert a discipline on the market as the outside
23 houses do in England. If the English money market
24 decide to gang up on the Bank of England and put in
25 an unreasonably low bid for bills, the outside houses
26 would probably get them, and I think that if the market
27 became a market of four or five dealers here doing
28 most of the business that the rest of us could come
29 and go as we saw fit, and if we thought bills were
30 going too cheaply we would be able to impose a
discipline on those major houses, but that your
market over-all would be broadened in the number of
people who would participate in it. The bank would
probably not have the same control over the members'

1
2
3 inventories.

4 COMMISSIONER BROWN: This would indicate
5 that you assume the market would get into a narrower
6 control at the expense of the Bank of Canada, really?

7 MR. CAMERON: I think there are people who
8 are, to use the vernacular, engaged in shovelling
9 smoke part of the time. If they are members of the
10 money market, "we may not want to bid for bills this
11 week but we feel we have to".

12 COMMISSIONER BROWN: And your idea was that
13 this creates a false market?

14 MR. CAMERON: And this is a condition of
15 the market you can well be without.

16 COMMISSIONER BROWN: It would be a truer
17 market if it were free?

18 MR. CAMERON: And it would be much better
19 if there were 40 people able to go into the bill
20 market as and when they felt like it and not because
21 it was expected of them.

22 COMMISSIONER BROWN: Where would you draw
23 the line -- anybody on the Bank of Canada list could?

24 MR. CAMERON: Anybody on the Bank of Canada
25 list who was willing to post the necessary margin.

26 COMMISSIONER BROWN: And this would be
27 without limit on excess -- I just wanted to get a
28 little more detailed picture of how it would operate.

29 MR. CAMERON: If you are bidding the
30 3 per cent basis for three-month treasury bills
your price is about 99-1/4. So, even to post the
full margin between the 99-1/4 price and maturity
price at par would only require 3/4 of a point.
This might make it attractive for a fellow who

1
2
3 hadn't thought he had a market for bills in the
4 province next week, to bid for bills, and the margin
5 is not onerous; it would cost him \$7,500 on a
6 million at full margin, and at that the margin may
7 be only half of that.

8 COMMISSIONER BROWN: And would you have
9 all these dealers having access to the day-to-day
10 money market?

11 MR. CAMERON: Yes. I think that under our
12 chartered bank system that would be feasible, and
13 with the Bank of Canada branches.

14 COMMISSIONER MACKINTOSH: Later on you
15 speak of conflicts of interest in the securities
16 market: Would this be relieved if the underwriters
17 were separated from the distributors and dealers?

18 MR. CAMERON: I would hope it would be,
19 although our markets are small enough it may take
20 some time before we develop a full complement of
21 brokers, jobbers and underwriters such as the
22 English have.

23 COMMISSIONER MACKINTOSH: I gather -- or
24 I think I remember gathering from the Radcliffe
25 Report that jobbers were a disappearing race in the
26 English market.

27 MR. CAMERON: They have been rather badly
28 hit by the activities of the Bank of England at
29 times, and also by the incidence of succession
30 duties which has impaired their capital. I recall
from Radcliffe one gentleman, Sir Frederick Leaf
Ross who complained vociferously that the Bank of
England on one occasion called an issue for redemption
and apparently brought out a new issue on which the

1
2
3 jobbers took a park, and within ten days raised
4 the bank rate substantially causing 5 points loss on
5 this bond within a month.

6 COMMISSIONER BROWN: This is like the
7 conversion loan.

8 MR. CAMERON: Which, on a five-year bond,
9 is quite a substantial loss. Sir Frederick's
10 complaint was that the Bank of England was rigging
11 the market and trying to take advantage of the
12 jobbers.

13 COMMISSIONER MACKINTOSH: I gather your
14 view is that it would be desirable if underwriting
15 was separated from distribution, but that you think
16 any divorce of that kind would take quite a while
17 having regard to the size and continuity of our
18 market.

19 MR. CAMERON: I think that brokers and
20 underwriters should be separated eventually so that
21 you will know whether the customs man, the salesman,
22 is acting as your agent or whether he is the employee
23 of the house engaged to distribute the house's
24 merchandise.

25 COMMISSIONER MACKINTOSH: Don't they always
26 state whether they are selling this as agents or
27 principals?

28 MR. CAMERON: It is probably all there in
29 the fine type, but I can assure you the average retail
30 client -- and I remember in the days when I was
engaged in the business that involved retail clients --
seldom understood.

THE CHAIRMAN: Just one point I would like
to refer to, going back to what you mentioned earlier;

1
2
3 you mentioned it in your additional submission, where
4 you say: "Keynes, in the early 1920's, cites similar
5 price levels for the years 1826, 1841, 1855, 1862,
6 1871 and 1915, and a somewhat lower common level
7 for 1844, 1881 and 1914. From 1826 to 1914 the
8 maximum price variation in any direction was 30 per
9 cent." Is it not true that during those periods
10 when the price level fell that there were serious
11 depressions in Great Britain?

12 MR. CAMERON: Indeed there were, sir, and
13 in those days I think the adjustment of the economy
14 is not reflected in the value of money but in the
15 standard of living of the working man and on the number
16 of unemployed.

17 THE CHAIRMAN: But when the prices were on
18 rise the depression disappeared, or it was alleviated?

19 MR. CAMERON: And I doubt if the working
20 man got a commensurate increase in wages.

21 THE CHAIRMAN: He may have got some wages,
22 and he wasn't getting any before.

23 MR. CAMERON: He got more work.

24 COMMISSIONER MACKINTOSH: Aside from the
25 early years after the Napoleonic war real wages in
26 Britain rose pretty consistently during the 19th
27 century and including the depression period.

28 MR. CAMERON: You were getting a real increase
29 in productivity throughout most of that period and
30 the development of new sources of raw materials and
more economic ways of transporting them. These were
the things that tended to make it easier for the
British to, possibly accidentally, keep the purchasing
power of the pound within reasonable limits and make

1
2
3 the gold standard work.

4 COMMISSIONER MACKINTOSH: Well, popular
5 standards have changed. We had a cost of living
6 commission in this country about 1912 tackling
7 the critical fact that the cost of living had
8 risen about 1 per cent per annum over the past 12
9 or 15 years.

10 MR. CAMERON: I am afraid you might have
11 to have another five royal commissions in the next
12 year.

13 THE CHAIRMAN: Apparently that royal
14 commission did not cure anything.

15 COMMISSIONER GIBSON: I have one question:
16 You say in the brief at page 20 that Canada's N.H.A.
17 mortgage, affording $6\frac{1}{2}$ per cent to institutions,
18 is far more attractive than long Canada bonds at
19 just over 5 per cent. We have heard quite a few
20 witnesses who don't agree with you, and feel that
21 much should be done to make this N.H.A. mortgage
22 more attractive and more interesting. Do you have
23 any views on this about a market for these mortgages?

24 MR. CAMERON: My view is, from the
25 institutional point of view, most of our institutions
26 were in the conventional mortgage business long before
27 the N.H.A. They have facilities for servicing
28 mortgages, and it would cost some of them possibly
29 one-half of one per cent if they had a large volume,
30 so that they net six, and this does make it more
attractive than a government bond at five.

COMMISSIONER GIBSON: Do you see quite a
lot of institutional buyers buying these mortgages?

MR. CAMERON: No, they are usually placing

1
2
3 them rather than buying them.

4 COMMISSIONER GIBSON: Placing them in
5 funds, and so on ?

6 MR. CAMERON: Well, the figures show there
7 is quite a volume done by the private insurance
8 companies with some exceptions. Those exceptions
9 do a large mortgage business but prefer the
10 conventional mortgage.

11 As to making the mortgages marketable in
12 the sense they can be sold to the small investor,
13 I think out of a given disposable personal income
14 there is probably only an inclination to save so
15 much, and if you are going to make mortgages more
16 appealing to this type of buyer, and you succeed,
17 you are going to diminish his participation in other
18 forms of saving, be it savings bonds or bank deposits
19 or the issues of other borrowers. I think there is
20 perhaps too much emphasis put on this for what it
21 would accomplish.

22 COMMISSIONER GIBSON: Thank you very much,
23 Mr. Cameron.

24 THE CHAIRMAN: Thank you very much indeed,
25 Mr. Cameron; it has been a most stimulating discussion
26 and we are indebted to you for your excellent submission.

27 MR. CAMERON: Thank you for the privilege
28 of appearing, Mr. Chairman.

29 THE CHAIRMAN: We will now adjourn until
30 9.15 tomorrow morning.

Adjournment.

Royal Commission on Banking and Finance

Hearings
held at
Toronto

Vol.
12A

Date.

SUBMISSION TO THE

ROYAL COMMISSION

ON

BANKING AND FINANCE

This submission is made jointly as private citizens by:

Martin W. Goodman

Geoffrey R. Conway

Mr. Conway, 15 Merrill Ave., Belmont, Mass., is a Toronto chartered accountant now enrolled in the doctoral program, Graduate School of Business Administration, Harvard University.

Mr. Goodman, 344 Irving St., Cambridge, Mass., is a financial writer for the Toronto Daily Star, on leave for a year as a Visiting Fellow at Harvard University.

We would be pleased to appear in Toronto, our city of domicile, at the hearings April 12-13 or 14-15, should the Royal Commission so desire.

SUMMARY

This submission touches on two areas under consideration by the Royal Commission on Banking and Finance:

- Economic growth, and specifically the inadequate flow of capital into certain vital sectors;
- Chartered banks, and specifically their use of inner reserves.

Our analysis suggests that the high investment rate we enjoyed during the 1950's did not produce a sound base for expansion in the 1960's. We find the economy needs revitalization. Fortunately the ingredients are all available, but they require stimulation and direction. We find need for:

- More private investment in areas that will produce Canadian jobs and Canadian goods and Canadian technology;
- More government investment in social capital;
- More capital for small business expansion;
- More capital for mortgages for used houses.

The program we assemble to meet these needs involves specific investment projects totalling more than \$4,000 million and provides incentives for desirable investment by private citizens and industry.

Revenue losses are offset throughout--there need be no deficit financing--and the basic program could be implemented immediately.

We begin by examining the chartered banks. We find their accumulated tax-free inner reserves are excessive. Under current practice they constitute a permanent government subsidy, on which the banks over the next 10 years could net \$100 million. We find the inner reserves cloaked in needless secrecy which misleads the public and shareholders. We find they contribute to excessive bank earnings. Lastly, we find the banks deliberately use inner reserves to disguise the true course of earnings and profits. Against a declared rate of return of 6.9 per cent, we find an actual rate of 10 per cent.

consideration by the Royal Commission on Banking and

flow of capital into certain vital sectors;
- Chartered banks, and specifically their use of
further reserves.

Our analysis suggests that the high investment rate
we enjoyed during the 1950's did not produce a sound
base for expansion in the 1960's. We find the economy
needs revitalization. Particularly the infrastructure is
all available, but they require stimulation and
direction. We find need for:

- More private investment in areas that will
produce Canadian jobs and Canadian goods and Canadian

- More government investment in social capital;
- More capital for small business expansion;
- More capital for mortgages for mass housing.

The program we assemble to meet these needs involves
specific investment projects totaling more than \$4,000
million and provides incentives for desirable
investment by private citizens and industry.

Revenue losses are offset throughout--there need be
no deficit financing--and the cash program could be

We begin by examining the chartered banks. We find

government subsidy, on which the banks over the next 10
years could net \$100 million. We find the lower reserves
cleared in monetary policy which strangles the private
and entrepreneurs. We find they contribute to excessive
bank earnings. Lastly, we find the banks deliberately use
inner reserves to disguise the true course of earnings
and profits. Against a declared rate of return of 6.9 per
cent, we find an actual rate of 10 per cent.

1
2 We propose that tax-free inner reserves be limited
3 to three times the average annual loss experience for
4 the previous 25 years. The tax liability this would
5 establish on present reserves--about \$150 million--
6 should be paid within 10 years in equal annual amounts.
7 We also suggest fuller disclosure of inner reserves.

8 We propose the government use \$50 million to
9 guarantee private lenders against loss on mortgages
10 for used houses, and \$100 million to guarantee private
11 lenders against loss on loans for small business
12 expansion. This would result in mortgages and loans
13 worth \$3,500 million.

14 We attempt to meet our other goals by a better tax
15 mix, to stimulate growth, and through more government
16 investment in social capital, to provide research
17 facilities and improved education and technical training.

18 We provide investment incentives through personal
19 tax reductions and accelerated depreciation.

20 To meet these revenue losses, we suggest taxation of
21 capital gains and an increase in the manufacturers sales
22 tax. We propose to shift some of the tax burden from
23 income to consumption.

24 Besides the stimulus of this program to growth, there
25 would be a net gain in government revenues throughout.
26 This would finance the government's social capital
27 program. Within five years, this investment would amount
28 to \$800 million in current dollars. Using only a
29 conservative multiplier, this alone would raise GNP
30 by \$1,600 million.

31 The introduction discusses the economy and some of
32 its needs. Recommendations dealing with the banks and
33 the mortgage and loan program are under "Recommendations
34 I." Those dealing with the tax structure are under
35 "Recommendations II." Each is preceded by an analysis of
36 the area concerned, and followed by a discussion of the
37 program's effects. Documentation and tables are
38 contained in the appendices.

We propose that tax-free inner reserves be limited to three times the average annual loss experience for the previous 25 years. The tax liability this would establish on present reserves--about \$150 million--should be paid within 10 years in equal annual amounts. We also suggest fuller disclosure of inner reserves. We propose the Government use \$50 million to guarantee private lenders against loss on mortgages for used houses, and \$100 million to guarantee private lenders against loss on loans for small business expansion. This would result in mortgages and loans worth \$7,500 million. We attempt to meet our other goals by a better tax mix, to stimulate growth, and through more government investment in social capital, to provide research facilities and improved education and technical training. We provide investment incentives through personal tax reductions and accelerated depreciation. To meet these revenue losses, we suggest taxation of capital gains and an increase in the manufacturers sales tax. We propose to shift some of the tax burden from income to consumption. Besides the stimulus of this program to growth, there would be a net gain in Government revenues throughout. This would finance the Government's social capital program. Using only a conservative multiplier, this alone would raise GNP by \$1,500 million. The introduction discusses the economy and some of its needs. Recommendations dealing with the banks and the mortgage and loan program are under "Recommendations I." Those dealing with the tax structure are under "Recommendations II." Part is preceded by an analysis of the area concerned, and followed by a discussion of the program's effects. Documentation and tables are contained in the appendix.

INTRODUCTION

1. Canada is at a crossroads.
2. The boom country of the 1950's has lost its economic momentum. It is drifting indecisively.
3. As citizens concerned that the nation regain momentum, we welcome this opportunity to place our views before this Royal Commission. Our submission is limited in scope, but our suggestions may provide some guidelines for the road we all want to follow.
4. The steps a country in economic difficulties must take can never be popular. We believe, however, that the people are prepared to accept direction back to the high road to prosperity. Whatever recommendations are made and whatever structure is devised, the result will not be perfect to all. To do nothing, however, is to do harm to all.
5. To a large extent, the success of economic policy depends on the reactions of the private sector. To a larger extent, it depends on the leadership and role of the federal government.
6. We do not start with any predilection for government as against private investment. We do not think that men in government are better than private entrepreneurs at judging the outcome of particular investment projects. We do think government is better able to judge the outcomes of various constellations of investment programs. It is also better able to assume the risks associated with them, since many of the rewards accrue, not to the particular projects in which the initial investment is made, but to the nation as a whole.
7. This role of leadership--not to be confused with control--was reflected by the Commission on Money and Credit, a privately-sponsored group which last year completed a survey of U.S. financial institutions, policies and practices similar to the one this Royal Commission is undertaking.

INTRODUCTION

1. Canada is at a crossroads.
2. The four countries of the 1970's have lost the economic momentum. It is drifting indecisively.
3. As citizens concerned that the nation regain momentum, we welcome this opportunity to place our views before this Royal Commission. Our submission is limited in scope, but our suggestions may provide some guidelines for the road we all want to follow.
4. The steps a country in economic difficulties must take can never be popular. We believe, however, that the people are prepared to accept direction back to the high road to prosperity. Whatever recommendations are made and whatever structure is devised, the result will not be perfect to all. To do nothing, however, is to do harm to all.
5. To a large extent, the success of economic policy depends on the reactions of the private sector. To a larger extent, it depends on the leadership and role of the federal government.
6. We do not start with any prescription for government as against private investment. We do not think that men in government are better than private entrepreneurs at judging the outcome of particular investment projects. We do think government is better able to judge the outcomes of various constellations of investment programs. It is also better able to assume the risks associated with them, since many of the rewards accrue, not to the particular projects in which the initial investment is made, but to the nation as a whole.
7. This role of leadership--not to be confused with control--was reflected by the Commission on Money and Credit, a privately-sponsored group which last year completed a survey of U.S. financial institutions, policies and practices similar to the one this Royal Commission is undertaking.

1
2 8. Its recommendations, particularly in the area of
3 banking and credit, reflected a consensus that the
4 government's role is large and that it has a prime duty
5 to do all it can to spur growth.¹ It is to this task of
6 providing leadership and incentives that we have
7 directed this submission.

8 9. For more than a decade Canada experienced
9 prosperity with little effort. We had a high volume of
10 public and private investment. We enjoyed full employment
11 and worried about demand inflation. Yet we ran into
12 difficulties. We discovered the lasting truth of John
13 Stuart Mill's dictum, "The demand for commodities is
14 not the demand for labor." More importantly, we ran
15 into economic problems at a time when other countries
16 were regaining prosperity and growth.

17 10. The result is that at a time when international
18 opportunities are calling, we are not able to respond.
19 The high rate of investment during the 1950's did not
20 produce for the 1960's an economic structure emphasizing
21 Canadian jobs and Canadian goods and Canadian technology.
22 Now the rate of investment is dropping dangerously.

23 11. The problem is to make the nation move ahead
24 again. We have the capacity to do so. If the world were
25 frozen in present stages of economic development, we
26 would be the second most prosperous nation. We have a
27 high level of know-how and technology. We have vigor
28 and desire. Since the world is not frozen, but ever
29 more dynamic and competitive, the task is to redirect
30 our capacities towards the goals of economic prosperity:
Full employment, rising growth, stable prices.

12. Our analysis concludes the nation's main concern
is a lack of investment producing Canadian jobs and
Canadian goods. We find an improper mix of taxes and
incentives which impedes the best flow of resources for
expansion and development. We believe the answer lies in
added incentives, to industry and citizens, to invest in
areas that will produce Canadian jobs and Canadian
goods and Canadian technology.

8. Its recommendations, particularly in the area of banking and credit, reflected a consensus that the Government's role is large and that it has a prime duty to do all it can to spur growth. It is to this task of providing leadership and incentives that we have directed this commission.

9. For more than a decade Canada experienced prosperity with little effort. We had a high volume of public and private investment. We enjoyed full employment and worried about demand inflation. Yet we ran into difficulties. We discovered the lasting truth of John Stuart Mill's dictum, "The demand for commodities is not the demand for labor." More importantly, we ran into economic problems at a time when other countries were retaining prosperity and growth.

10. The result is that at a time when international opportunities are calling, we are not able to respond. The high rate of investment during the 1950's did not produce for the 1960's an economic structure emphasizing Canadian jobs and Canadian goods and Canadian technology. Now the rate of investment is dropping dangerously. 11. The problem is to make the nation move ahead again. We have the capacity to do so. If the world were frozen in present stages of economic development, we would be the second most prosperous nation. We have a high level of know-how and technology. We have vigor and desire. Since the world is not frozen, but even more dynamic and competitive, the task is to redirect our capacities towards the goals of economic prosperity.

12. Our analysis concludes the nation's main concern is a lack of investment producing Canadian jobs and Canadian goods. We find an improper mix of taxes and incentives which impedes the best flow of resources for expansion and development. We believe the answer lies in areas that will produce Canadian jobs and Canadian goods and Canadian technology.

13. We also believe more investment is needed in social capital. Canada, as W.W. Rostow noted in his analysis of economic growth, entered the stage of mass consumption before technological maturity was attained.² We have not, on the whole, invested enough in the social foundation that sound economic growth requires. A skilled and efficient labor force depends on the quality of secondary and university education. New industries and technology depend on research and development.

14. Too frequently investment is thought of only in terms of machinery and equipment. Too frequently education is classed as consumption rather than as investment. In recent years too much lip service and not enough money has been devoted to improving and widening university and technical training. Overwhelmingly we must invest in people. They are our most precious resource. The Royal Commission on Canada's Economic Prospects said:

15. "The Canadian economy must accomodate itself continuously to the conditions of a highly competitive world in which the pace of growth and development will be determined largely by the ability to use the fruits of scientific research and technological improvements. The free flow of scientific and technical information between countries is in the interests of all. Canada has gained and will continue to gain from the process. But the rate of growth in Canada would be retarded if Canadian industry were to rely to too large an extent on innovations originating in other countries. In our own interest we must make a significant original contribution to technological advance. This means expansion of support for research and of the numbers of qualified research scientists, and an adequate supply of the skilled workers necessary to apply the new knowledge and techniques."³

16. Last year's Bank of Canada report emphasized the continuing need:

17. "Investment in human capital can at times do more for growth of output than investment in physical capital. Improved education in general, higher education for a larger proportion of those leaving high school, technological development and training, scientific

13. We also believe more investment is needed in social capital. Canada, as W.W. Rostow noted in his analysis of economic growth, entered the stage of mass consumption before technological maturity was attained. We have not, on the whole, invested enough in the social foundation that sound economic growth requires. A skilled and efficient labor force depends on the quality of secondary and university education. New industries and technology depend on research and development.

14. Too frequently investment is thought of only in terms of machinery and equipment. Too frequently education is classed as consumption rather than as investment. In recent years too much lip service and not enough money has been devoted to improving and widening university and technical training. Overwhelmingly we must invest in people. They are our most precious resource. The Royal Commission on Canada's Economic Prospects said:

15. "The Canadian economy must accommodate itself continuously to the conditions of a highly competitive world in which the pace of growth and development will be determined largely by the ability to use the fruits of scientific research and technological improvements. The free flow of scientific and technical information between countries is in the interests of all. Canada has gained and will continue to gain from the process. But the rate of growth in Canada would be retarded if Canadian industry were to rely to too large an extent on innovations originating in other countries. In our own interest we must make a significant original contribution to technological advance. This means expansion of support for research and of the numbers of qualified research scientists, and an adequate supply of the skilled workers necessary to apply this new knowledge and techniques."

16. Last year's Bank of Canada report emphasized the continuing needs:

17. "Investment in human capital can at times be more for growth of output than investment in physical capital. Improved education in general, higher education for a select group of young people, and training, scientific technological development and training, scientific

1
2 research, and the development of skills and aptitudes
3 of the widest diversity as required in modern industry,
4 can produce very marked increases in productivity and
5 in total production. Such an improvement in human
6 capital can help to develop new forms of industry and
7 rapid expansion in the advanced technologies more
8 effectively than can be achieved by straining for more
9 and more physical investment whether provided by
10 foreign investors or otherwise."⁴

11 18. We believe investment in social capital has
12 been lagging. The glamor of space and defence needs
13 of the cold war have caused some increased awareness
14 of the need for research and development. An example
15 is the Defence Industrial Research Program, under which
16 Canadian firms can get government help at scientific
17 and financial levels for projects with reasonable sales
18 potential.⁵ But Canadian research and development (as
19 a percentage of GNP) is only one-third that of the U.S.
20 or Britain. It is vital to urge greater effort, and
21 not only in the military field. To spend proportionally
22 half what the U.S. devotes to research and development
23 would require additional expenditures of more than
24 \$200 million. (See Appendix I.)

25 19. To accomplish all our goals requires action by
26 government, industry and citizens. The government can
27 determine the extent of its own contribution and
28 fulfill it. It can only provide incentives, however,
29 to insure that industry and the populace carry out
30 their roles. We believe these incentives are missing
in today's financial structure. We believe they must
be carefully shaped to produce the desired effects.
But they must be provided.

21 20. "Neither coercion nor cajolery is consistent with
22 the principles of a free economy. Freedom implies that
23 the individual can choose his occupation or choose
24 between working and not working; and the amount of work
25 he does is related to his material rewards and
26 expectations. If the most effective use is to be made
27 of human resources the question of economic incentives
28 to the individual therefore cannot be brushed aside."⁶

research, and the development of skills and aptitudes of the widest diversity as required in modern industry, can produce very marked increases in productivity and in total production. Such an improvement in human capital can help to develop new forms of industry and rapid expansion in the advanced technologies more effectively than can be achieved by striving for more and more physical investment whether provided by foreign investors or otherwise."

18. We believe investment in social capital has been lacking. The glamor of space and defence needs of the cold war have caused some increased awareness of the need for research and development. An example is the Defence Industrial Research Program, under which Canadian firms can get government help at scientific and financial levels for projects with reasonable sales potential.⁵ But Canadian research and development (as a percentage of GNP) is only one-third that of the U.S. or Britain. It is vital to urge greater effort, and not only in the military field. To spend proportionally half what the U.S. devotes to research and development would require additional expenditures of more than \$200 million. (See Appendix I.)

19. To accomplish all our goals requires action by Government, industry and citizens. The Government can determine the extent of its own contribution and fulfill it. It can only provide incentives, however, to insure that industry and the province carry out their roles. We believe these incentives are missing in today's financial structure. We believe they must be carefully shaped to produce the desired effects. But they must be provided.

20. "Neither coercion nor bribery is consistent with the principles of a free economy. Freedom implies that the individual can choose his occupation or choose between working and not working; and the amount of work he does is related to his material rewards and expectations. If the most effective use is to be made of human resources the question of economic incentives to the individual therefore cannot be brushed aside."⁶

1
2
3 21. We propose to examine areas where meaningful
4 steps could be taken to provide these incentives. If
5 it is possible to also correct inequity in the existing
6 structure, we attempt to do so. We suggest the following
7 program to raise public and private investment, aimed
8 at Canadian jobs and Canadian goods and Canadian
9 technology:

- 10 - A reduction in personal income tax rates;
- 11 - Canadian dividends and interest tax-free up to
- 12 \$50;
- 13 - Accelerated depreciation for certain types of
- 14 capital assets;
- 15 - Increased government investment in social capital;
- 16 - Government programs to raise the flow of funds
- 17 into mortgages and small business expansion.

18 22. To obtain revenues for this program we propose:

- 19 - Taxation of capital gains of more than \$500;
- 20 - An increase in the manufacturers sales tax;
- 21 - Withdrawal of tax exemption from excessive inner
- 22 reserves of the chartered banks.

23 23. We propose to use the special tax from the
24 chartered banks to finance mortgages and small business
25 expansion. Our program would produce \$3,500 million
26 in mortgages and loans.

27 24. The rest of our program would increase the flow
28 of private investment into industry and the amount of
29 government investment in social capital. Neither
30 deficit financing nor a redirection of present
government revenues would be necessary. In fact, there
would be a net gain in government revenues, to finance
its expanded social capital program. This new govern-
ment investment would total \$800 million within five
years. After a conservative multiplier effect, this
would add more than \$1,600 million to GNP.

25 25. It would be irresponsible to claim the nation
26 could move itself ahead effortlessly. The argument on
27 whether the key, however, is to increase demand or
28 supply is as old as economics.

26. The right emphasis varies with specific situations and aims at some balance--a program where supply stimulates demand and demand sets the stage for further increases in supply. The essence of the argument, in fact, dates to Ricardo and Malthus:

27. Malthus stated: "Yet it will be most readily allowed that the saving from revenue to add to capital is an absolutely necessary step in the progress of wealth. How then is this saving to take place without producing the diminution of value apprehended?"

"It may take place, and practically always does take place, in consequence of a previous increase of value, or of revenue, in which case a saving may be effected, not only without any diminution of demand and consumption, but under an actual increase of demand, consumption and value during every part of the process. And it is in fact this previous increase of value and revenue which both gives the great stimulus to accumulation, and makes that accumulation effective in the continued production of wealth."

Ricardo commented, "This is the way undoubtedly."

Malthus added, "The fortune of a country, though necessarily made more slowly, is made in the same way as the fortunes of individuals in trade are generally made--by savings, certainly; but by savings which are furnished from increased gains, and by no means involve a diminished expenditure on objects of luxury and enjoyment."

Ricardo commented, "It will however be allowed that an individual may improve his fortune by a diminished expenditure on objects of luxury and enjoyment. Why may not a country do the same?"⁷

28. Canada has reached a standard of living where it is reasonable to tax consumption to finance progress. As an economic and social goal, inequality has been declining in urgency. The urgent need is to revitalize the economy on a sound foundation.

29. "From a dollars-and-cents point of view, it is quite obvious that over a period of years, even those who find themselves on the short end of inequality have more to gain from faster growth than from any conceivable income redistribution."⁸

30. We recognize, with regret, that today those at the bottom may be particularly unable to make their plight heard and known. Their unhappy situation is a

26. The right emphasis varies with specific situations and aims at some balance--a program where supply stimulates demand and demand sets the stage for further increases in supply. The essence of the

27. Melthus stated: "What it will be most readily allowed that the saving from revenue to add to capital is an absolutely necessary step in the progress of wealth. How then is this saving to take place without producing the diminution of value apprehended?" "It may take place, and practically always does take place, in consequence of a previous increase of value, or of revenue, in which case a saving may be effected, not only without any diminution of demand, and consumption, but under an actual increase of demand. And it is in fact this previous increase of value and revenue which both gives the great stimulus to accumulation, and makes that accumulation effective in the continued production of wealth."

Ricardo commented, "This is the way undoubtedly." Melthus added, "The fortune of a country, though necessarily made more slowly, is made in the same way as the fortunes of individuals in trade are generally made--by savings, certainly; but by savings which are furnished from increased gains, and by no means involve a diminished expenditure on objects of luxury and enjoyment."

Ricardo commented, "It will however be allowed that an individual may improve his fortune by a diminished expenditure on objects of luxury and enjoyment. Why may not a country do the same?"

28. Canada has reached a standard of living where it is reasonable to tax consumption to finance progress. As an economic and social goal, inequality has been declining in urgency. The urgent need is to revitalize the economy on a sound foundation.

29. "From a dollar-and-cents point of view, it is quite obvious that over a period of years, even those who find themselves on the short end of inequality have more to gain from faster growth than from any conceivable income redistribution."

30. We recognize, with regret, that today there are the bottom may be particularly unable to make their right heads and know, their unhappy situation is a

1
2 task for other government legislation than may be your
3 concern. But the pattern of repetition can be broken
4 only through an increase in social capital. To
5 eliminate the residuals of poverty the nation must
6 invest in high-quality schools, strong health services,
7 slum clearance, expansion of low- and middle-income
8 housing.

9 31. An ideal investment and tax scheme is perhaps
10 not immediately attainable. We would prefer, for
11 instance, a combination of net worth and expenditure
12 taxes in place of the income tax. There are still too
13 many practical difficulties to recommend this. We do
14 urge the Royal Commission to recognize the pressing
15 need for change and to provide practical guidelines.

14 CHARTERED BANKS

15 32. Canada's chartered banks enjoy a position of
16 privilege and a role of public trust. This is
17 reflected in special legislation dealing with banks
18 and in the mandate of this Royal Commission. It was
19 acknowledged by the president of the Canadian Bankers
20 Association in 1944, S.W. Wedd, who identified the
21 chartered banks as "quasi-public servants."⁹

22 33. Our main concern with the banks is the system
23 of tax-free inner reserves. This allowance has so far
24 deviated from its original purpose that it now
25 constitutes a permanent government subsidy. It is
26 used to hide from the public and shareholders the true
27 nature of bank earnings, and it has contributed to
28 excessive earnings.

29 34. Inner reserves represent an accumulation of
30 annual charges to operating earnings, to guard against
losses on loans and investments. The policy is
sensible. Since loans made in a specific year may
become bad debts in a future year, it is reasonable to
allow the banks to provide for probable loss before
computing their tax liability.

task for other government legislation than may be your concern. But the pattern of repetition can be broken only through an increase in social capital. To eliminate the residuals of poverty the nation must invest in high-quality schools, strong health services, slum clearance, expansion of low- and middle-income housing.

31. An ideal investment and tax scheme is perhaps not immediately attainable. We would prefer, for instance, a combination of net worth and expenditure taxes in place of the income tax. There are still too many practical difficulties to recommend this. We do need for change and to provide practical guidelines.

CHARTERED BANKS

32. Our main concern with the banks is the system of tax-free inner reserves. This allowance has no tax devoted from its original purpose that it now constitutes a permanent government subsidy. It is used to hide from the public and shareholders the true nature of bank earnings, and it has contributed to

33. Inner reserves represent an accumulation of annual charges to operating earnings, to guard against losses on loans and investments. The policy is sensible. Since loans made in a specific year may become bad debts in a future year, it is reasonable to allow the banks to provide for probable loss before

1
2 35. The complexities of administering this policy,
3 however, have led to a situation where the banks are
4 allowed to accumulate a tax-free amount out of all
5 proportion to the losses they might suffer. The banking
6 structure has changed, economic controls have developed,
7 but the banks continue to calculate tax-free inner
8 reserves as if a depression worse than that of the
9 1930's was around the corner. The result is a permanent
10 reserve of more than 30 times average annual losses of
11 the last 25 years. U.S. commercial banks since 1947
12 have been allowed a reserve against losses of three
13 times the average loss ratio of the previous 20 years.
14 Other Canadian companies may only claim tax-free
15 reserves based on estimated losses.

16 36. To the extent that tax-free inner reserves
17 overstate probable losses, they constitute an
18 unwarranted tax benefit or subsidy. The average annual
19 loss experience from 1936-60 was .167 per cent. We
20 calculate the accumulation of tax-free inner reserves
21 at the end of 1960 was more than \$325 million or almost
22 5 per cent of related assets. (See Appendix II.)

23 37. The excess against what is actually required
24 appears to be \$300 million. Since under current practice
25 this need never be reduced, it provides the banks with
26 \$150 million they would otherwise have to pay in taxes.
27 In essence, this means a permanent interest-free loan
28 from the government. The use of this money for 10
29 years, at a 5 per cent net return after taxes, would
30 yield another \$100 million.

31 38. The status of tax-free inner reserves has been
32 discussed at every revision of the Bank Act in this
33 century, with special attention in 1944 when they were
34 the subject of a formal statement by Hon. J.L. Ilsey,
35 Minister of Finance. The statement received less
36 attention than it deserved, having been delivered
37 June 6, 1944.

35. The complexities of administering this policy, however, have led to a situation where the banks are allowed to accumulate a tax-free amount out of all profits in the income tax system. This is not a desirable situation and the banks continue to calculate tax-free income reserves as if a depreciation worse than that of the 1930's was around the corner. The result is a permanent reserve of more than 30 times average annual losses of the 1930's. This is a very large reserve and have been allowed a reserve against losses of three times the average loss ratio of the previous 20 years. Other Canadian companies may only claim tax-free reserves based on estimated losses.

36. To the extent that tax-free income reserves overstate probable losses, they constitute an unwarranted tax benefit or subsidy. The average annual loss experience from 1936-50 was .167 per cent. We calculate the accumulation of tax-free income reserves at the end of 1960 was more than \$25 million or almost 5 per cent of related assets. (See Appendix II.)

37. The excess against what is actually required appears to be \$500 million. Since under current practice \$150 million they would otherwise have to pay in taxes. In essence, this means a permanent interest-free loan from the government. The use of this money for 10 years, at a 5 per cent net return after taxes, would yield another \$100 million.

38. The status of tax-free income reserves has been discussed at every revision of the Bank Act in this century, with special attention in 1944 when they were the subject of a formal statement by Hon. J.L. Flanagan, Minister of Finance. The statement received less attention than it deserved, having been delivered June 6, 1944.

39. There are other undesirable aspects to the inner reserves.

40. The secrecy surrounding them is unnecessary and unfair to both the public and 100,000 holders of bank shares (as estimated by the Canadian Bankers Association in 1960). While the Bank of Canada reports the annual charge to earnings for inner reserves of the chartered banks as a group, individual banks do not make public either the annual appropriation or the accumulated balance. In effect, a bank's annual report shows assets and earnings after inner reserve transfers.

41. The inner reserves, however, increase a bank's working capital, which is particularly important to accurately determine the book value of a chartered bank. In the last six years, for every \$1 of net earnings reported by the banks, an average of 32 cents has been added to inner reserves.

42. Some bank officers might argue this is of no concern to shareholders. The president of the Canadian Bankers Association in 1954, T.H. Atkinson, said:

43. "... the contingency reserves are not part of the banks' capital funds in the sense that they do not belong to the shareholders. They are built up to cover losses in investments which are bound to take place from time to time. They tend to be large when times are good and loans are rising and they are inevitably drawn upon when times are less favorable."¹⁰

44. To the extent that reserves permanently exceed losses, they do belong to shareholders. Assessments of bank stocks try to take the inner reserves into account, but for individual banks are frustrated by lack of information. The present annual statements amount to misinformation and are neither in the public nor the shareholders' interest.

45. The banks use the inner reserves to show a steady but restrained growth in earnings. This is done through irregular transfers. In years of high operating earnings, not transfers to inner reserves are high.

There are other unclassified reserves to the
The secrecy surrounding them is unnecessary and
unfair to both the public and 100,000 holders of bank
shares (as estimated by the Canadian Bankers Association
in 1960). While the Bank of Canada reports the annual
charge to earnings for inner reserves of the chartered
banks as a group, individual banks do not make public
either the annual appropriation or the accumulated
balance. In effect, a bank's annual report shows
assets and earnings after inner reserve transfers.
40. The inner reserves, however, increase a bank's
working capital, which is particularly important to
accurately determine the book value of a chartered
bank. In the last six years, for every \$1 of net
earnings reported by the banks, an average of 12 cents
has been added to inner reserves.
42. Some bank officers might argue that it is of no
concern to shareholders. The president of the Canadian
Bankers Association in 1954, T.H. Atkinson, said:
43. "... the contingency reserves are not part
of the banks' capital funds in the sense that they do
not belong to the shareholders. They are built up to
cover losses in investments which are bound to take
place from time to time. They tend to be larger when
times are good and losses are rising and they are
inevitably drawn upon when times are less favorable."
44. To the extent that reserves permanently exceed
losses, they do belong to shareholders. Assessments
of bank stocks try to take the inner reserves into
account, but for individual banks are frustrated by
lack of information. The present annual statements
amount to misinformation and are neither in the public
nor the shareholders' interest.
45. The banks use the inner reserves to show a
steady but restrained growth in earnings. This is done
through irregular transfers. In years of high earnings
earnings, not transfers to inner reserves are high.

1
2
3 In years of low earnings, net transfers are low or
4 there may be a transfer out of inner reserves into
5 current earnings.

6 46. The banks have gone even further in using inner
7 reserves to disguise the true course of earnings. The
8 net transfer to inner reserves has not consisted of
9 one lump transfer to meet possible losses, but often
10 of a double shift, to depress earnings to a desired
11 level. First a sum is deducted from pre-tax operating
12 earnings and placed in inner reserves. Then a smaller
13 sum is transferred from inner reserves to shareholders'
14 equity. Taxes are paid on the amount moved into share-
15 holders' equity, of course, but the effect on declared
16 earnings is striking. There is the unusual situation
17 of shareholders' equity growing more than the net
18 profits less dividends. From 1956-60 shareholders'
19 equity increased by \$60.2 million from net profits
20 remaining after dividends. But equity increased by at
21 least \$138.9 million as a result of retransfers from
22 inner reserves. (See Appendix III.)

23 47. This procedure is objectionable and the banks
24 should be discouraged from its practice.

25 48. How far the public picture is from the truth
26 can be seen in an examination of actual earnings.
27 Declared net earnings after taxes for the last decade
28 averaged a reasonable 6.8 per cent. When retransfers
29 are included, earnings averaged a not-so-reasonable
30 9 per cent. If actual losses rather than reserve
provisions are charged, earnings averaged a definitely
unreasonable 10 per cent. (See Appendix IIIA.)

49. This return for a relatively secure enterprise
like banking is strikingly high compared with other
business groups or the 7 per cent limit for regulated
utilities. (See Appendix IV.) It provides a marked
contrast with the situation in 1944 when Mr. Ilsey
remarked:

In years of low earnings, not transfers are low or there may be a transfer out of inner reserves into

46. The banks have gone even further in using inner reserves to disguise the true extent of earnings. The not transfer to inner reserves has not consisted of one lump transfer to meet possible losses, but often of a double shift, to depress earnings to a desired level. First a sum is deducted from pre-tax operating earnings and placed in inner reserves. Then a smaller sum is transferred from inner reserves to shareholders' equity. Taxes are paid on the amount moved into shareholders' equity, of course, but the effect on declared earnings is striking. There is the unusual situation of shareholders' equity growing more than the net equity increased by \$60.2 million from net profits remaining after dividends. But equity increased by at least \$138.2 million as a result of transfers from inner reserves. (See Appendix III.)

47. This procedure is objectionable and the banks should be discouraged from its practice.
48. How far the public picture is from the truth can be seen in an examination of actual earnings. Declared net earnings after taxes for the last decade averaged a respectable 6.8 per cent. When retirements are included, earnings averaged a not-so-respectable 9 per cent. If actual losses rather than reserve provisions are charged, earnings averaged a definitely unrespectable 10 per cent. (See Appendix IIIA.)
49. This return for a relatively secure enterprise like banking is strikingly high compared with other business groups or the 7 per cent limit for regulated utilities. (See Appendix IV.) It provides a marked contrast with the situation in 1944 when Mr. Flay

50. "I suggest that our main concern is to see whether the earnings of the banks before appropriations to inner reserves are excessive at 6 per cent on the shareholders' equity."¹¹

51. This is how the Royal Bank of Canada used the device last year. To begin with a commendation, only the Royal Bank in recent years has at least included the rotransfer from inner reserves in its statement of undivided profits, before the second shift into rest fund. This is what the directors' report said for the year ended Nov. 30, 1961:

Profits for the year, after provision for depreciation and ^x income taxes and after making transfers to inner reserves out of which full provision has been made for diminution in value of investments and loans.....	\$20,759,844	(1)
Dividends	16,629,613	
	<hr/>	
	4,130,231	

Transferred from inner reserves after provision for ^x income taxes exigible	10,000,000	(2)
^x Total provision for income taxes	\$30,750,000	(3)

52. Since the Royal Bank paid taxes at roughly a 50-per-cent rate, it only takes some minor arithmetic--but much careful probing--to see that not profit reported to the government was about \$61,500,000, which would leave \$30,750,000 and balances the provision for taxes, line (3). The difference between this and the profits the bank reported to shareholders, line (1), is what passed through the inner reserves, line (2).

53. The declared net profit per share, \$3.12, was based on line (1). The shareholders received \$2.50 while apparently 62 cents went to retained earnings, a division not likely to arouse anyone.

54. Actual net profit per share should be calculated not on line (1) but on line (3), which would total \$4.63. Deduct \$2.50, and the true amount that went to retained earnings--without the public or shareholders really seeing it--was \$2.13.

50. "I suggest that our main concern is to see whether the earnings of the bank before appropriations to inner reserves are excessive at 6 per cent on the

51. This is how the Royal Bank of Canada read the device last year. To begin with a comparison, only the Royal Bank in recent years has at least included the transfer from inner reserves in its statement of funds. This is what the directors' report said for the

year ended Nov. 30, 1961:

Profits for the year, after provision for depreciation and income taxes and after making transfers to inner reserves out of which full provision has been made for diminution in value of investments and loans.... \$20,758,844 (2)

Transferred from inner reserves after provision for income taxes payable..... 10,000,000 (3)
* Total provision for income taxes \$30,758,844 (3)

52. Since the Royal Bank paid taxes at roughly a 50-per-cent rate, it only takes some minor arithmetic but much careful probing--to see that not profit reported to the Government was about \$61,500,000.

which would leave \$30,750,000 and balance the provision for taxes, line (5). The difference between this and the profits the bank reported to shareholders, line (1), is what passed through the inner reserves,

53. The declared net profit per share, \$3.12, was based on line (1). The shareholders received \$2.50 while apparently 62 cents went to retained earnings, a division not likely to arouse anyone.

54. Actual net profit per share should be calculated not on line (1) but on line (3), which would total \$4.62. Deduct \$2.50, and the true amount that went to retained earnings--without the public or shareholders really seeing it--was \$2.12.

1
2 55. Similarly, the declared return on shareholders'
3 equity based on declared profits, line (1), is a
4 healthy but restrained 6.9 per cent. Use the real
5 profit, line (3), and it turns into an eyebrow-raising
6 10.2 per cent. Truly a case of now you don't see it,
7 now you do.

8 56. Since the comparable figures for lines (1) and
9 (2) have added to line (3) in recent years, it's
10 probable the Royal Bank, like most banks, is at or
11 near its maximum tax-free inner reserves. And this
12 bank, it should be noted, is reporting more openly
13 than any other.

14 57. In passing, we suggest the present rate of
15 return would allow the banks to raise interest rates
16 on savings accounts, to provide more capital to small
17 business and to operate within a maximum interest
18 rate of 6 per cent on loans.

RECOMMENDATIONS I

31 58. The Minister of Finance should restrict tax-free
32 inner reserves to three times the average annual loss
33 experience of the previous 25 years on related assets,
34 or to an amount calculated by an account-by-account
35 review, whichever is greater.

36 59. The tax liability thus established on current
37 inner reserves should be paid in equal amounts over
38 a period not exceeding 10 years.

39 60. The government should earmark this revenue
40 for two funds: (a) One fund of \$50 million to be
41 administered by CMHC to guarantee private lenders
42 against loss on approved mortgages on purchases of
43 used houses; (b) The balance, about \$100 million, to
44 be used to guarantee private lenders against loss on
45 approved loans for small business expansion.

46 61. The Bank of Canada should report the annual loss
47 experience of all chartered banks as well as the average
48 annual 25-year loss experience.

55. Similarly, the declared return on shareholders' equity based on declared profits, line (1), is a healthy but restrained 6.9 per cent. Use the real profit, line (3), and it turns into an eye-opening 10.2 per cent. Truly a case of how you don't see it, now you do.

56. Since the comparable figures for lines (1) and (3) have added to line (3) in recent years, it is probable the Royal Bank, like most banks, is at or near its maximum tax-free inner reserves. And this bank, it should be noted, is reporting more openly.

57. In passing, we suggest the present rate of return would allow the banks to raise interest rates on savings accounts, to provide more capital to small business and to operate within a maximum interest rate of 6 per cent on loans.

58. The Minister of Finance should restrict tax-free inner reserves to three times the average annual loss experience of the previous 25 years on related assets, or to an amount calculated by an account-by-account review, whichever is greater.

59. The tax liability thus established on current inner reserves should be paid in equal amounts over a period not exceeding 10 years.

60. The government should earmark this revenue for two funds: (a) One fund of \$50 million to be administered by CMHC to guarantee private lenders against loss on approved mortgages on purchases of used houses; (b) The balance, about \$100 million, to be used to guarantee private lenders against loss on approved loans for small business expansion.

61. The Bank of Canada should report the annual loss experience of all chartered banks as well as the average annual 25-year loss experience.

1
2 62. The Bank of Canada should report annually the
3 total inner reserves held by the chartered banks,
4 specifying the tax-free portion.

5 63. The individual banks should annually report
6 accumulated reserves, either as a note to the balance
7 sheet or as a deduction from assets. They would not be
8 required to disclose the split between tax-free and
9 tax-paid reserves, and they would not be required to
10 change their method of declaring net profit or
11 shareholders' equity.

12 64. The banks should be discouraged from passing
13 operating earnings to shareholders' equity by
14 retransfers from the inner reserves.

15 65. We do not quarrel with the banks' right--and
16 even obligation--to set aside the reserves they feel
17 they require. Nor do we quarrel with their desire to
18 project the image of a soundly-managed institution,
19 showing a progressive increase in earnings without
20 severe fluctuations. But what constitutes an adequate
21 tax-free allowance is, after all, a matter of opinion.¹²

22 66. It is probably easier to obtain a consensus on
23 what constitutes an inadequate reserve, or an excess
24 reserve. The present situation, we suggest, is clearly
25 in excess. Limiting tax-free reserves to one year's
26 loss experience, granting the conservative history of
27 chartered banks, would be inadequate. We believe three
28 times the annual average of 25 years' loss experience
29 is a reasonable tax-free allowance.

30 67. The tax liability this would establish on
existing reserves, paid over 10 years, would still
leave the banks with adequate funds to meet their
responsibilities, especially in light of their true
earnings. This liability would be less than 1 per cent
of total assets. If they had paid it over the last 10
years earnings would still have been 9 per cent. And
the banks would benefit from the new use of the funds.

62. The Bank of Canada should report annually the total inner reserves held by the chartered banks, specifying the tax-free portion.

63. The individual banks should annually report regulated reserves, which are held in the form of cash or as a deduction from assets. They would not be required to disclose the split between tax-free and tax-paid reserves, and they would not be required to change their method of declaring net profit or shareholders' equity.

64. The banks should be discouraged from passing operating earnings to shareholders' equity by transfers from the inner reserves.

65. We do not quarrel with the banks' right—and even obligation—to set aside the reserves they feel they require. Nor do we quarrel with their desire to protect the image of a soundly-managed institution, showing a progressive increase in earnings without any excessive tax-free allowance in the matter of opinion. It is probably easier to obtain a consensus on the present situation, we suggest, is clearly in excess. Limiting tax-free reserves to one year's loss experience, granting the conservative history of chartered banks, would be inadequate. We believe three times the annual average of 25 years' loss experience is a reasonable tax-free allowance.

66. The tax liability this would entail on existing reserves, paid over 10 years, would still leave the banks with adequate funds to meet their responsibilities, especially in light of their long earnings. This liability would be less than 1 per cent of total assets. If they had paid it over the last 10 years earnings would still have been 9 per cent. And the banks would benefit from the new use of the funds.

68. This new method of computing tax-free inner reserves would have little or no effect on the banks' tax liability in future years on current operations. Tax-free inner reserves appear in recent years to have stayed close to the limit allowed under present regulations. The opportunity for tax reduction is thus limited by the annual increase in assets. The main effect on cash flow would be the necessity to meet the liability on existing reserves.

69. Similarly the liability need not affect dividends. The banks could charge the tax to inner reserves, so as not to diminish declared shareholders' equity.

70. More specific disclosure of the annual loss experience and the amount of inner reserves is necessary to preserve the banks' faith with the public and shareholders.

71. It has been argued that non-disclosure is needed because annual fluctuations in inner reserves might mislead the public. It might even result, it was argued, in a flight of capital from a particular bank.¹³

72. Mr. Ilsey, for instance, warned what might happen should a gimlet-eyed citizen catch a dip in the amount of inner reserves:

73. "We know how easy it is to distort facts about technical matters and to start rumors that have no foundation. We know that once started, baseless rumors give rise to whispering campaigns that are likely to cause an untold amount of damage, particularly to persons with small incomes and small savings. I am convinced that we should not lightly take such risks."¹⁴

74. Mr. Ilsey's words might just as easily have been used to favor full disclosure. Certainly it is easier to start rumors when the facts are not known than when they are. The speculative information now available is far more likely to mislead the public than specific information. A method of annual accounting that tries to keep the public from going down one garden path by leading them down another has nothing to commend it.

68. This new method of computing tax-free income reserves would have little or no effect on the banks' tax liability in future years on current operations. Tax-free income reserves appear in recent years to have stayed close to the limit allowed under present regulations. The opportunity for tax reduction is thus limited by the annual increase in assets. The main effect on cash flow would be the necessity to meet the liability on existing reserves.

69. Similarly the liability need not affect dividends. The banks could charge the tax to income reserves, so as not to diminish declared shareholders' equity.

70. More specific disclosure of the annual loss experience and the amount of income reserves is necessary to preserve the banks' faith with the public and shareholders.

71. It has been argued that non-disclosure is needed because annual fluctuations in their reserves might mislead the public. It might even result, it was argued, in a flight of capital from a particular bank.

72. Mr. Lacey, for instance, warned what might happen should a similar-eyed citizen catch a glimpse of the amount of income reserves:

73. "We know how easy it is to distort facts about technical matters and to start rumors that have no foundation. We know that once started, baseless rumors give rise to whispering campaigns that are likely to cause an untold amount of damage, particularly to persons with small incomes and small savings. I am convinced that we should not lightly take such risks."

74. Mr. Lacey's words might just as easily have been used to favor full disclosure. Certainly it is easier to start rumors when the facts are not known than when they are. The speculative information now available is far more likely to mislead the public than specific information. A method of annual accounting that will keep the public from going down one garden path by leading them down another has nothing to commend it.

15. Mr. Ilsey's statement even ended on a somewhat different note. He announced his intention to collate and publish bank statistics to "enable parliament and the public to obtain regularly the information which is significant for determining whether the banks are making too much profit and whether they have too much left over out of earnings available for inner reserves to take care of their probable requirements over a period of years."¹⁵ Granting the ambiguity of the last phrase, the key figure that surely would be needed for accurate assessment would be total inner reserves.

76. Mr. Ilsey also argued that inner reserves against bad or doubtful debts are rarely disclosed in ordinary business.¹⁶ But the trend today, encouraged by bodies like the Toronto Stock Exchange, is to more disclosure. "The outstanding trend in accounting thought over the past few decades in this country as in Great Britain and the United States, has been towards fuller disclosure in company accounts."¹⁷ Showing reserves is more likely to produce confidence than merely stating there are reserves without any details.

77. It has also been argued that the existence of inner reserves increases a bank's willingness to accept higher risks.

78. That banks take any more risk than they cannot avoid is a debatable proposition at best. At any rate, we would not take away the individual bank's right to determine what reserves it requires to safeguard its operations. Nor would the bank have to indicate publicly how much of the reserves constituted a tax-free allowance. All we suggest is that it is not the government's task to subsidize bank policy, particularly when there are more important areas that require scarce resources.

79. In any case it is hardly likely that the excellent reputation of Canadian banks rests on the

15. Mr. Ilsey's statement even ended on a somewhat different note. He announced his intention to collect and publish bank statistics to "enable Parliament and the public to obtain regularly the information which is significant for determining whether the banks are making too much profit and whether they have too much left over out of earnings available for inner reserves to take care of their probable requirements over a period of years."¹⁵ Granting the ambiguity of the last phrase, the key figure that surely would be needed for the purpose would be the ratio of reserves to deposits against bad or doubtful debts are rarely disclosed in ordinary business.¹⁶ But the trend today, encouraged by bodies like the Toronto Stock Exchange, is to more disclosure. "The outstanding trend in accounting thought over the past few decades in this country as in Great Britain and the United States, has been towards fuller disclosure in company accounts."¹⁷ Growing reserves is more likely to produce confidence than merely stating there are reserves without any details.

17. It has also been argued that the existence of inner reserves increases a bank's willingness to accept higher risks.

18. That banks take any more risk than they cannot avoid is a debatable proposition at best. At any rate, we would not take away the individual bank's right to determine what reserves it requires to safeguard its operations. Nor would the bank have to indicate publicly how much of the reserves constituted a tax-free allowance. All we suggest is that it is not the government's task to subsidize bank policy, particularly when there are more important areas that require scarce resources.

19. In any case it is hardly likely that the excellent reputation of Canadian banks rests on the

1
2 inner reserves. If this was such a key item in holding
3 public confidence the entire banking structure should
4 have come down in 1933 when--in the only recorded such
5 instance--five banks transferred \$29.5 million from
6 published rest funds to bolster inner reserves. Other
7 factors must surely be at work, particularly since
8 from 1929-43, despite the depression, inner reserves
9 still increased by \$10.3 million while the rest fund
10 remained steady after 1933.

11 80. The best place to find an answer is from the
12 government and Bank of Canada. The government's informal
13 commitment to protect the public is behind confidence
14 in the chartered banks. Naturally this commitment has
15 never been made explicitly--there would then be little
16 need for shareholders--but it was consciously implicit
17 to a generation that knew one depression and didn't
18 care for another. The Bank of Canada's first governor,
19 Graham Towers, on several occasions pledged support
20 should a chartered bank ever experience a run on
21 deposits. Mr. Ilsey summed up the situation in 1944:

22 81. "As a last resort, the central bank may come to
23 the rescue but reliance on the central bank should not
24 be a steady diet or be any excuse for failure of the
25 chartered banks to maintain themselves in a sound and
26 strong condition."¹⁸

27 82. As a last note, the best guarantee against the
28 banks ever running into difficulties is a healthy
29 economy. We suggest the mortgage and loan programs
30 we recommend are a better way to achieve this than
31 any system of withholding information.

32 MORTGAGE AND LOAN PROGRAMS

33 83. The government programs we recommend, paid for
34 by the banks' added tax liability, would benefit not
35 only the economy in general but the chartered banks
36 in particular.

84. Using \$150 million to guarantee mortgages and loans to small business in effect would mean mortgages and loans worth \$3,500 million. Much of this, as it multiplied through the economy, would reach the banks as deposits, particularly if they raised the interest rate on deposits. The net result, we conclude, would be a vital transfusion to needy areas, from funds now in less productive use.

85. (Some of the windfall revenue would belong to the provinces under the federal-provincial tax agreements. We suggest the provinces would contribute their portions to the mortgage and loan programs, since both would bring almost as much direct benefit to the provinces as could any provincial use of the funds.)

86. Certainly the areas for which the funds would be earmarked deserve speedy consideration.

87. Housing is one of the economy's vital sectors. In 1960, after the first and mid-year surveys of investment predicted an increase over 1959, a sharp drop in housing expenditures was enough to bring total investment below the 1959 level.

88. We believe one of the main difficulties is the split in markets between relatively new houses with NHA guarantees and relatively older houses without. Buyers do not divide so simply. Difficulty in obtaining a mortgage at a reasonable rate for a used house distorts the market for new houses beyond all reason. People rent instead of buy, or permanently postpone their purchase, or take mortgages with high interest rates and low coverage and the inevitable necessity for a second mortgage. The evils of this practice constitute a shocking indictment of the private mortgage field.

89. Using relatively little money and the proven administration of CMHC, the federal government could bring about a vast change. Our mortgage program would

1
2 also supplement and complement the government's effort
3 to create a secondary mortgage market in Canada.

4 90. We propose that the government pledge \$50
5 million of its revenue to an insurance fund to
6 guarantee loans for approved mortgages on purchases
7 of used houses. Our aim would be a high guarantee
8 against loss to insure equitable terms for buyers and
9 adequate incentive to investors. We calculate \$2,500
10 million in mortgages--200,000 houses carrying an
11 average mortgage of \$12,500--would result from a
12 program along the following lines:

13 91. Mortgages would be granted to 80 per cent of
14 the value of the house up to a maximum mortgage of
15 \$16,000. The interest rate should be the same as on
16 NHA mortgages. The insurance charge should be 3 per
17 cent instead of the present 2 per cent on NHA
18 mortgages, to provide additional protection for the
19 investor. Should the loss ratio prove the same as on
20 NHA mortgages, the insurance charge should be reduced.
21 As in NHA mortgages, liability would be limited to the
22 size of the insurance fund.

23 92. If the insurance fund was 5 per cent of
24 outstanding mortgages, it would thus have \$50 million
25 from the government and \$75 million from insurance
26 charges, or provision for \$2,500 million in mortgages.

27 93. The terms would provide adequate incentive to
28 pension funds, credit unions and trust and insurance
29 companies. All are growing rapidly and are seeking
30 relatively secure investments. This mortgage program
would ideally suit their needs.

94. Money now going into second mortgages for used
houses represents investment in risk ventures. This
would not be withdrawn from the investment field, but
would turn to other venturesome areas. Particularly
if our recommendations were followed to make industrial
investment more attractive, there would be ample
outlets for this money.

also support and complement the government's effort to create a secondary mortgage market in Canada.

We propose that the government pledge \$50

million of its revenue to an insurance fund to guarantee loans for approved mortgages on purchases of used houses. Our aim would be a high guarantee against loss to insure equitable terms for buyers and adequate incentive to investors. We estimate \$2,500 million in mortgages--200,000 houses carrying an average mortgage of \$12,500--would result from a

program along the following lines:

91. Mortgages would be granted to 80 per cent of the value of the house up to a maximum mortgage of \$16,000. The interest rate would be the same as on FHA mortgages. The insurance charge should be 3 per cent instead of the present 2 per cent on FHA mortgages, to provide additional protection for the investor. Should the loss rate prove the same as on FHA mortgages, the insurance charge should be reduced. As in FHA mortgages, liability would be limited to the size of the insurance fund.

92. If the insurance fund was 2 per cent of outstanding mortgages, it would thus have \$50 million from the government and \$5 million from insurance charges, or provision for \$2,500 million in mortgages.

93. The terms would provide adequate incentive to pension funds, credit unions and trust and insurance companies. All are growing rapidly and are seeking

would ideally suit their needs.

94. Money now going into second mortgages for used houses prevents investment in risk ventures. This would not be withdrawn from the investment field, but would turn to other venturesome areas. Particularly if our recommendations were followed to make industrial investment more attractive, there would be ample

1
2 95. The government's responsibility to insure
3 adequate funds for small business expansion has been
4 recognized since 1944, when the Industrial Development
5 Bank was established as a subsidiary of the Bank of
6 Canada. Last year this was supplemented with the
7 Small Business Loans Act. We consider this area--so
8 vital to the economy's growth--still insufficiently
9 provided with expansion capital.

10 96. Small business is every bit as inventive and
11 productive as large. But left to itself, small
12 business only has local or personal sources of
13 capital. It is at a disadvantage compared with large
14 business with access to regional, national or even
15 international money markets.

16 97. We suggest using the balance of the added bank
17 liability--about \$100 million--to guarantee private
18 lenders against loss on approved loans for small
19 business expansion. The structure would follow that
20 of the Small Business Loans Act but certain limits
21 should be expanded.

22 98. As in the present act, loans should be for
23 improvement and modernization of equipment and
24 premises for businesses in manufacturing, wholesale
25 or retail trade and service industries. It would not
26 apply to professional, charitable or religious groups.

27 99. Loans should continue to be made for up to 80
28 per cent of the purchase price of equipment and 90
29 per cent for premises. The 10-year term and 5½ per
30 cent interest rate should be continued. The gross
revenue limitation should be increased to \$2 million,
compared to \$250,000 under the original act. Maximum
loans should be \$100,000 compared to \$25,000 now.

100. The present act limits the guarantee to 10 per
cent of the loans made by a bank with the program
effectively limited to loans of \$300 million. Using
the same criteria, a fund of \$100 million would allow
\$1,000 million in loans.

1
2
3 101. There is as yet insufficient data to judge the
4 response of chartered banks to the Small Business Loans
5 Act. They would appear to have sufficient funds to
6 participate--ratio of liquid assets to deposit
7 liabilities is a high 19 per cent. If the response
8 proves disappointing, the program should be opened to
9 other federally regulated lenders, such as trust and
insurance companies, and/or the interest rate could
be raised.

10 102. The banks, however, to fulfill their public
11 role, should be encouraged to back this program, if
12 necessary by shifting out of loans to large public
13 companies. Such companies have adequate alternative
14 sources of capital. The shift would mean a slight
15 increase in administrative costs to the banks, but
16 our analysis of their earnings indicates they could
17 easily absorb this.

18 TAXATION

19 103. Our next area of concern involves the effects
20 of certain aspects of taxation on the flow of
21 investment available for social and physical capital.
22 The aim of our proposals is to increase investment in
23 areas where Canadian goods, jobs and technology would
24 benefit. We provide incentive for saving--and thus
25 for investment--by shifting some of the burden of
26 taxation from income to consumption.

27 104. Our concern here is not the tax structure
28 as such, although by its very nature, adjusting one
29 tax requires adjustments to others to maintain
30 revenues. Consequently our proposals touch on the
personal income tax, capital gains, capital cost
allowances and the manufacturers sales tax.

101. There is as yet insufficient data to judge the

Act. They would appear to have sufficient funds to

facilities at a high 19 per cent. If the response
proves disappointing, the program should be opened to
other federally regulated lenders, such as trust and
insurance companies, and/or the interest rate could
be raised.

102. The banks, however, to fulfill their public
role, should be encouraged to back this program, if
necessary by shifting out of loans to large public
companies. Such companies have adequate alternative
sources of capital. The shift would mean a slight
increase in administrative costs to the banks, but
our analysis of their earnings indicates they could
easily absorb this.

103. Our next area of concern involves the effects
of certain aspects of taxation on the flow of
investment available for social and physical capital.
The aim of our proposals is to increase investment in
areas where Canadian goods, jobs and technology would
benefit. We provide incentive for saving—and thus
for investment—by shifting some of the burden of
taxation from income to consumption.

104. Our concern here is not the tax structure
as such, although by its very nature, adjusting the
tax requires adjustments to others to maintain
revenues. Consequently our proposals focus on the
personal income tax, capital gains, capital cost
allowances and the manufacturers sales tax.

RECOMMENDATIONS II

105. Personal tax rates should be reduced according to the scale set out in Appendix V. This would result in a maximum rate of 60 per cent compared to the present 80 per cent, with substantially lower rates for middle-income groups and lesser decreases for lower-income groups.

106. The first \$50 of income from Canadian dividends or interest should be tax-free.

107. The capital cost provisions for new Class 8 machinery and equipment should allow a special 50 per cent write-off in any year, in addition to the present 20 per cent annual allowance.

108. Capital gains of more than \$500 should be defined as investment income and included in taxable income. A proposed method of taxation is outlined in the section on capital gains. It provides for averaging the gain, allows capital losses to be deducted from capital gains with unlimited carry-forward, and has special provisions for personal property such as houses.

109. The manufacturers sales tax should be increased to 14 per cent from 11 per cent.

110. Exemption from the sales tax of purchases of imported Class 8 machinery and equipment employed directly in production should be cancelled, unless the machinery and equipment is used to produce exports and cannot be made in Canada.

111. Tax revenues in the first year of this program would balance as follows:

Losses: (millions)		Gains: (millions)	
Personal taxes	\$175	Capital gains	\$100
Capital cost allowance	200	Sales tax	300
	<u>\$375</u>		<u>\$400</u>

112. Losses from the special capital cost allowance drop rapidly, since the allowance could be claimed only in one year and would leave less available to claim in future years. Ignoring tax revenues that would result

RECOMMENDATIONS II

105. Personal tax rates should be reduced according

to the scale set out in Appendix V. This would result

in a maximum rate of 60 per cent compared to the

present 80 per cent, with substantially lower rates

for middle-income groups and lesser decreases for

lower-income groups.

106. The first \$50 of income from Canadian

dividends or interest should be tax-free.

107. The capital cost provisions for new Class 8

machinery and equipment should allow a special 50

per cent write-off in any year, in addition to the

present 20 per cent annual allowance.

108. Capital gains of more than \$500 should be

defined as investment income and included in taxable

income. A proposed method of taxation is

the section on capital gains. It provides for

averaging the gain, allows capital losses to be

deducted from capital gains with unlimited carry-

forward, and has special provisions for personal

property such as houses.

109. The manufacturers sales tax should be

increased to 14 per cent from 11 per cent.

110. Exemption from the sales tax of purchases of

imported Class 8 machinery and equipment employed

directly in production should be cancelled, unless

the machinery and equipment is used to produce

exports and cannot be made in Canada.

111. Tax revenues in the first year of this

program would balance as follows:

Personal taxes	\$175	Capital gains	\$100
Capital cost allowance	200	Sales tax	300
			400
	\$375		\$400

112. Losses from the special capital cost allowance

drop rapidly, since the allowance could be claimed only

in one year and would leave less available to claim in

future years. Ignoring tax revenues that would result

1
2
3 from economic growth, the net gain in revenues would
4 eventually reach \$225 million in constant dollars--
5 more than double the federal government's 1961-62
6 budget for university and technical training and
7 national research. We could conservatively assume
8 continuation of a 3 per cent growth rate and a nominal
9 amount of new industrial investment, so losses from
10 the special capital cost allowance would be eliminated
11 by the fifth year. The government's new investment in
12 social capital would then amount to \$800 million in
13 current dollars during this five-year period.

14
15 113. Some of these proposals would affect
16 provincial revenues under the federal-provincial
17 sharing agreements. This aspect is examined after
18 the section on capital cost allowances.

19 PERSONAL TAXES

20 114. The changes we recommend in personal income
21 tax rates should stimulate investment. Disposable
22 income would increase at all brackets but the lowest.
23 We balance this reduction with higher taxes on
24 consumption. At the middle and upper levels, there
25 would be a net gain. We make it attractive to channel
26 the gain into profitable investment. If the person
27 instead chose to increase consumption, his gain would
28 be taxed. At the lower levels, the reduction in income
29 tax is offset by the increased sales tax. A net gain
30 would occur only if consumption was foregone for
investment.

31 115. In some aspects, this might seem inequitable.
32 Unfortunately, so is any tax structure yet devised by
33 man. The main goal is to again make the nation vigorous
34 and competitive. Everyone gains from growth. If we
35 wait to devise the perfect method for spreading the
36 burden of spurring growth, we will go nowhere.

from economic growth, the net gain in revenues would eventually reach \$225 million in constant dollars. The budget for university and technical training and amount of new industrial investment, as losses from the special capital cost allowance would be eliminated by the fifth year. The government's new investment in social capital would then amount to \$800 million in 1975-76. Some of these proposals would affect provincial revenues under the federal-provincial sharing agreements. This aspect is examined after the section on capital cost allowances.

PERSONAL TAXES

114. The changes we recommend in personal income tax rates should stimulate investment. Disposable income would increase at all brackets but the lowest. We balance this reduction with higher taxes on consumption. At the middle and upper levels, there would be a net gain. We make it attractive to channel the gain into profitable investment. If the person instead chose to increase consumption, his gain would be taxed. At the lower levels, the reduction in income tax is offset by the increased sales tax. A net gain would occur only if consumption was foregone for investment.

115. In some aspects, this might seem inequitable. Unfortunately, so is any tax structure yet devised by man. The main goal is to again make the nation vigorous and competitive. Everyone gains from growth. If we wait to devise the perfect method for spreading the burden of slowing growth, we will go nowhere.

1
2
3 116. "It is the increase in output in recent
4 decades, not a redistribution of incomes, which has
5 brought the great material increase, the well-being
6 of the average man. . . . Production has eliminated
7 the more acute tensions associated with inequality."¹⁹

8 117. The anomaly of present high personal tax
9 rates is that they produce neither revenue nor
10 equality nor economic investment.

11 118. Only 2 per cent of personal tax revenue comes
12 from incomes of more than \$100,000, and 27.5 per cent
13 from incomes between \$10,000 and \$100,000. Our
14 adjustments to the rates on taxable income of more
15 than \$5,000 would reduce revenues by only 2.5 per
16 cent or \$45 million. This would more than be recovered
17 by our proposal to tax capital gains, most of which
18 occur in these income brackets.

19 119. The present structure does not produce
20 equality because there are so many ways to evade taxes.
21 The actual burden of the income tax--and its
22 progressivity--is much less than it appears from
23 the rate tables.

24 120. The structure discriminates in favor of
25 people who are better situated to arrange the way
26 they will take their income. The obvious method is
27 through capital gains, which are not taxed at all.
28 Division of property among members of a family,
29 judicious use of trusts, various executive compensation
30 plans and liberal depletion allowances are other ways
to lower tax rates.

121. A blatant loophole is the case of persons
dealing in stocks for gain. Present regulations make
many of these transactions taxable, such as the
investor who buys a new issue intending to sell a
week later. But it is practice, because of
administrative difficulties, to overlook rather
than tax.

factories, not a redistribution of income, which has brought the great material increase, the well-being of the average man. . . . Production has eliminated

rates is that they produce neither revenue nor

118. Only 2 per cent of personal tax revenue comes from incomes of more than \$100,000, and 2 1/2 per cent from incomes between \$10,000 and \$100,000. Our adjustments to the rates on taxable income of more than \$25,000 would reduce revenues by only 2.5 per cent or \$45 million. This would more than be recovered by our proposal to tax capital gains, most of which occur in these income brackets.

119. The present structure does not produce equality because there are so many ways to evade taxes. The general burden of the income tax--and its progressivity--is much less than it appears from the rate tables.

120. The structure discriminates in favor of people who are better situated to arrange the way they will take their income. The obvious result is through capital gains, which are not taxed at all. Division of property among members of a family, judicious use of trusts, various executive compensation plans and liberal depletion allowances are other ways to lower tax rates.

121. A blatant loophole is the case of persons dealing in stocks for gain. Present regulations make many of these transactions taxable, such as the investor who pays a new issue intending to sell a week later. But it is practical, because of administrative difficulties, to overlook rather

1
2 122. Current rates are also a disincentive to
3 economic investment. The only incentive of high
4 marginal rates is to lower taxable income. The result
5 is more effort seeking non-taxable income than
6 profitable investment, since it can be two to five
7 times more worthwhile to avoid tax rather than to
8 make money.

9 123. A \$25,000-a-year executive pays \$50 in taxes
10 if he earns another \$100. If he finds a way to get
11 \$100 capital gain, he keeps everything. When he
12 becomes a \$400,000-a-year board chairman, he keeps
13 only \$20 out of every \$100, one-fifth what he could
14 keep from a \$100 capital gain.

15 124. The result is a distorted allocation of
16 resources. The high-bracket individual will try a
17 speculative investment or set up a complicated
18 transaction to get \$2,000 in capital gain rather than
19 make a sound investment yielding \$3,000 in income.
20 Clearly it is not economic to allocate such extensive
21 individual and professional resources to tax
22 avoidance.

23 125. Our recommendations recognize the facts of
24 the income tax structure and seek to make economic
25 investment more attractive. The reduction at middle
26 and upper levels is designed to spur the incentive to
27 invest in desirable areas and to provide the funds to
28 do so. The proposed taxation of capital gains would
29 eliminate the greatest bar to rational economic
30 choice.

126. Our proposed highest rate is 60 per cent, on
taxable income exceeding \$125,000. This compares to
the present maximum of 80 per cent, on taxable income
exceeding \$400,000, with 60 per cent reached at
\$60,000. The assurance of retaining 40 cents out of
every \$1, no matter how high the income, would provide
incentive to assess investment through the best
allocation of resources, rather than incentive to
avoid taxable income.

127. Taxes would be reduced by 15 to 22 per cent above \$5,000 in taxable income, and by 7 to 14 per cent at lower levels, except for the very first bracket. (See Appendix V.)

128. The lower rates on taxable income under \$5,000 would reduce revenues by 7 per cent or \$130 million. This is equal to the effect of a 2 per cent sales tax increase on consumer goods.

129. We do not recommend any change in the lowest rate of 14 per cent, which applies on taxable income to \$1,000. This income level is undertaxed compared with benefits received. U.S. rates, by comparison, start at 20 per cent. Comparison with the U.S. and Britain at incomes up to \$5,000, including family allowance, shows Canadians in a preferred position at present rates. (See Appendix VI.) It is as fair to ask these income groups to pay their way through consumption taxes as through income taxes. At worst, if principle is ignored and actual dollar cost examined, the net increase in tax would be only \$7 to \$25 a year. (See Appendix VII.) We believe more equality is desirable in personal taxation, but it should be obtained through the estate tax.

130. The first \$50 of Canadian investment income, either dividends or interest, should be exempt from taxable income. Investment income of this amount is rarely taken into income in any case. It would be better to make this a positive element by giving small investors more incentive. A man with \$1,000 to invest, for instance, would probably not pay any tax on his investment income. There would be little change in government revenues; there should be a gain in investment incentive.

127. Taxes would be reduced by 15 to 25 per cent above \$2,000 in taxable income, and by 7 to 14 per cent at lower levels, except for the very first bracket. (See Appendix V.)

128. The lower rates on taxable income under \$2,000 would reduce revenues by 7 per cent or \$150 million. This is equal to the effect of a 3 per cent sales tax increase on consumer goods.

129. We do not recommend any change in the lowest rate of 14 per cent, which applies on taxable income to \$1,000. This income level is undistorted compared with benefits received. U.S. rates, by comparison, start at 20 per cent. Comparison with the U.S. and Britain at incomes up to \$2,000, including family allowance, shows Canadians in a preferred position at present rates. (See Appendix VI.) It is as fair to ask these income groups to pay their way through consumption taxes as through income taxes. At worst, if principle is ignored and actual dollar cost examined, the net increase in tax would be only \$1 to \$2 a year. (See Appendix VII.) We believe more equality is desirable in personal taxation, but it should be obtained through the estate tax.

130. The first \$50 of Canadian investment income, either dividends or interest, should be exempt from taxable income. Investment income of this amount is rarely taken into income in any case. It would be better to make this a positive element by giving small investors more incentive. A man with \$1,000 to invest, for instance, would probably not pay any tax on his investment income. There would be little change in government revenues; there should be a gain in investment incentive.

CAPITAL GAINS

131. Favorable treatment of capital gains reduces the progressiveness of the income tax. It is discriminatory, because it favors people who through luck or preferred position receive them.

132. A U.S. study shows most capital gains come from common stocks, with real estate a poor second and other property of minor importance.²⁰ They occur in a highly progressive fashion among income groups, so that those who least need such a preference get it.

Capital losses concentrate in middle-income groups.

Capital gains constitute a major source of income for higher-income groups.²¹

133. Logically capital gains should count as income, whether income is defined as consumption-plus-increase-in-wealth or as flow-of-wealth. The increase in value of any property increases a person's well-being just like an increase in any other kind of income, unless the general price level has risen in the same proportion (and in some cases, unless the interest rate has fallen). If a person buys stock for \$5,000 and sells it for \$10,000, the gain is available for consumption, or any other use, just as if he had received an additional \$5,000 in salary or profits from a business.

134. Nor is it just to exclude capital gains from taxation on economic grounds. If taxation of capital gains lessens the supply of capital for business expansion--and we do not agree that it does--so does all taxation of business earnings.

135. The difficulties arise in taxing capital gains in a system where liability is based on realization and rates are progressive. It is even more difficult, however, to justify not taxing capital gains, particularly when it is possible to develop an equitable method.

CAPITAL GAINS

131. Favorable treatment of capital gains reduces

the progressiveness of the income tax. It is

through lack of preferred position receive them.

132. A U.S. study shows most capital gains come

from common stocks, with real estate a poor second

and other property of minor importance.²⁰ They occur

in a highly progressive fashion among income groups,

so that those who least need such a preference get it.

Capital losses concentrate in middle-income groups.

Capital gains constitute a major source of income

for higher-income groups.

133. Logically capital gains should count as

income, whether income is defined as consumption-

plus-increase-in-wealth or as flow-of-wealth. The

increase in value of any property increases a

person's well-being just like an increase in any

other kind of income, unless the general price level

has risen in the same proportion (and in some cases,

unless the interest rate has fallen). If a person

buys a stock for \$5,000 and sells it for \$10,000, the

gain is available for consumption, or any other use,

just as if he had received an additional \$5,000 in

salary or profits from a business.

134. Nor is it just to exclude capital gains from

taxation on economic grounds. If taxation of capital

gains lessens the supply of capital for business

expansion--and we do not agree that it does--so does

all taxation of business earnings.

135. The difficulties arise in taxing capital gains

in a system where liability is based on realization

and rates are progressive. It is even more difficult,

however, to justify not taxing capital gains,

particularly when it is possible to develop an

equitable method.

136. It is frequently argued that favorable treatment of capital gains is necessary to maintain the flow of venture capital. The Harvard Business School series on the effects of taxation concluded that the possibility of capital gains was an important factor in encouraging investors "to shift funds out of relatively conservative investments offering little or no opportunity for capital appreciation, and into more venturesome types of investment" ²²

137. We contend the same result could be achieved by reducing personal income tax rates. A reduced upper limit, and a lower overall structure, would maintain the incentive to invest and reap income. Provision to balance capital losses against capital gains would add the incentive of knowing the government would share losses. Further, special treatment of capital gains may encourage too much speculation in risky ventures. New investment services the nation as long as there is a reasonable chance of success. Wild speculation, particularly in stock of highly risky ventures, simply interferes with the orderly flow of capital into useful channels.

138. The main argument against taxing capital gains rests on the locked-in problem. Investors are encouraged, it is argued, to hold on to securities or property in which gains have accrued, rather than selling and reinvesting. This causes investors to hold back their supply of a stock which has gained in value, to increase their capital gain, and to dump their supply in a decline, to take their capital loss. If this was true, locking-in would aggravate stock market rises and declines. But the Harvard study cited indicated the timing of investment transactions was affected by the U.S. capital gains tax by only 6 per cent. ²³ If it is profitable to shift, a shift will be made, although the margin to make a shift profitable might change slightly with taxation of capital gains.

136. It is frequently argued that favorable treatment of capital gains is necessary to maintain the flow of venture capital. The Harvard Business School series on the effects of taxation concluded that the possibility of capital gains was an important factor in encouraging investors "to shift funds out of relatively conservative investments offering little or no opportunity for capital appreciation, and into more venturesome types of investment. . . ." 22

137. We contend the same result could be achieved by reducing personal income tax rates. A reduced upper limit, and a lower overall structure, would maintain the incentive to invest and reap income. Provision to balance capital losses against capital gains would add the incentive of knowing the Government would share losses. Further, special treatment of capital gains may encourage too much speculation in risky ventures. New investment services the nation as long as there is a reasonable chance of success. Wild speculation, particularly in stock of highly risky ventures, simply interferes with the orderly flow of capital into useful channels.

138. The main argument against taxing capital gains rests on the locked-in problem. Investors are concerned, it is argued, to hold on to securities or property in which gains have accrued, rather than selling and reinvesting. This causes investors to hold back their supply of a stock which has gained in value, to increase their capital gain, and to dampen their supply in a decline, to take their capital loss. If this was true, locking-in would distort stock market rises and declines. But the Harvard study cited indicated the timing of investment transactions was affected by the U.S. capital gains tax by only 1 per cent.²³ If it is profitable to shift, a shift will be made, although the margin to make a shift profitable might change slightly with taxation of capital gains.

139. Locking-in, however, does not necessarily reduce the amount of new capital available for investment. An individual who sells a security for a capital gain does not create new money, he merely takes it from somebody else. The net effect depends what the new buyer would otherwise do with his money, compared with what the seller intends. If the buyer would otherwise invest in new ventures to the same extent, there would be no reduction in the flow of new venture capital.

140. Another objection is that capital gains merely reflect a general price increase. To some extent this may be true--but to the same extent there is no reason why stockholders and landholders should benefit from inflation. There is more merit to the counter-argument: Evils produced by inflation are so great that taxing capital gains arising from inflation cannot add to them and in part may offset them.

141. Similarly, it is argued that capital gains reflecting changes in the interest rate are fictitious. A person who buys a bond, then has it appreciate if interest rates drop, must invest all his gain in bonds to maintain previous interest earnings. If he is taxed on his capital gain, he could not maintain his old rate. But the investor might just as easily use his gain for consumption, in which case he would be better off.

142. We propose a method of taxing capital gains that spreads the income over the years it was earned. Thus it still represents relatively favorable treatment compared to ordinary income. We calculate it would produce at least \$100 million in added personal tax revenues. (See Appendix VIII.) The tax would be calculated as follows:

139. Looking-in, however, does not necessarily reduce the amount of new capital available for investment. An individual who sells a security for a capital gain does not create new money, he merely takes it from somebody else. The net effect depends what the new buyer would otherwise do with his money, compared with what the seller intends. If the buyer would otherwise invest in new ventures to the same extent, there would be no reduction in the flow of new venture capital.

140. Another objection is that capital gains merely reflect a general price increase. To some extent this may be true—but to the same extent there is no reason why stockholders and landholders should benefit from inflation. There is more merit to the counter-argument: Evils produced by inflation are so great that taxing capital gains arising from inflation cannot add to them and in part may offset them.

141. Similarly, it is argued that capital gains reflecting changes in the interest rate are fictitious. A person who buys a bond, then has it appreciate if interest rates drop, must invest all his gain in bonds to maintain previous interest earnings. If he is taxed on his capital gain, he could not maintain his old rate. But the investor might just as easily use his gain for consumption, in which case he would be better off.

142. We propose a method of taxing capital gains that spreads the income over the years it was earned. Then it still represents relatively favorable treatment compared to ordinary income. We calculate it would produce at least \$100 million in added personal tax revenues. (See Appendix VIII.) The tax would be calculated as follows:

1
2 143. The first \$500 of capital gain should be
3 exempt to save administrative difficulties on small
4 amounts and to provide incentive to small investors.

5 144. The remainder of the capital gain would be
6 divided by the number of years over which it was
7 earned. The years would be counted from the date of
8 purchase, with any fraction counting as one year.
9 This portion of the capital gain would be included
10 with other income for the current year and the tax
11 payable would be computed.

12 145. The amount of tax payable would next be
13 divided by the taxable income so far determined to
14 obtain an average rate of tax. The balance of the
15 capital gain would be multiplied by this average rate
16 to determine the tax payable on the balance of the
17 capital gain. In essence, the portion of the capital
18 gain attributable to prior years would be taxed at
19 the average tax rate on the current year's income.

20 146. Total tax liability would be obtained by
21 adding together the tax payable from each step.

22 147. Capital losses should be allowed as a deduction
23 from capital gains, with unlimited carry-forward.
24 Strict adherence to the net accretion theory would
25 mean deduction of capital losses from income in any
26 year they exceeded gains. It is necessary, however, to
27 prevent large decreases in government revenues in poor
28 years, since the level of government activity is such
29 a key factor in maintaining the economy. Such treat-
30 ment would also give undue encouragement to spec-
ulation. The U.S. restricts loss carry-forward to five
years but in part this reflects the preferred
treatment of capital gains.

148. It is argued that capital gains do not
represent ability to pay when the individual has to
replace the asset at higher price levels, such as a
house. We would exempt from capital gains taxation
gains (and losses) resulting from the sale of owner-
occupied houses and other personal property such as

143. The first \$500 of capital gain should be exempt to save administrative difficulties on small amounts and to provide incentive to small investors.

144. The remainder of the capital gain would be divided by the number of years over which it was earned. The years would be counted from the date of purchase, with any fraction counting as one year. This portion of the capital gain would be included with other income for the current year and the tax payable would be computed.

145. The amount of tax payable would next be divided by the taxable income so far determined to obtain an average rate of tax. The balance of the capital gain would be multiplied by this average rate to determine the tax payable on the balance of the capital gain. In essence, the portion of the capital gain attributable to prior years would be taxed at the average tax rate on the current year's income.

146. Total tax liability would be obtained by adding together the tax payable from each step.

147. Capital losses should be allowed as a deduction from capital gains, and capital losses should be carried forward to the next year if they exceed the capital gains for that year. It is necessary, however, to prevent large decreases in government revenue in poor years, since the level of government activity is such a key factor in maintaining the economy. Such a restriction would be necessary to prevent a large decrease in government revenue in poor years but in part this reflects the preferred treatment of capital gains.

148. It is argued that capital gains do not represent ability to pay when the individual has to replace the asset at higher price levels, such as a house. We would exempt from capital gains taxation gains (and losses) resulting from the sale of owner-occupied houses and other personal property such as

cars or furniture. An apartment owner would be free from capital gains tax on the portion accruing from his own apartment, but would be subject to taxation on the remainder.

149. The owner-occupied exemption should apply to only one acre of land. Anything larger represents a business asset, speculation or a luxury, and should be taxed.

150. To ease the locked-in problem, assets held until death would be taken over by the heirs, for income tax purposes, at original cost. An heir who sold an asset for a capital gain would thus have a tax liability, which would leave little incentive for deliberate locking-in before death. The heir, in computing tax liability, would average from the date of original purchase.

151. For succession duty purposes, valuation of assets would be at market value but would have to include consideration of the potential income tax liability. This could include provision for refunds when the tax is paid.

152. Capital gains should be defined as investment income, which would mean the application of the 4 per cent surtax on foreign gains. This is a useful disincentive to invest outside the country and perhaps should be increased, since the pressing need is for domestic development.

CAPITAL COST ALLOWANCES

153. Capital cost allowances are the major source of business saving in Canada. The rate at which industry is allowed to replace and maintain plant and equipment is thus a key to private investment in capital goods.

154. From 1951-60, capital cost allowances provided more than 80 per cent of business saving. The sources

cars or furniture. An apartment owner would be free from capital gains tax on the portion remaining from his own apartment, but would be subject to taxation on the remainder.

149. The owner-occupied exemption should apply to only one acre of land. Anything larger represents a business asset, speculation or a luxury, and should be taxed.

150. To ease the locked-in problem, assets held until death would be taken over by the heirs, for income tax purposes, at original cost. An heir who sold an asset for a capital gain would thus have a tax liability, which would leave little incentive for deliberate locking-in before death. The heir, in computing tax liability, would average from the date of original purchase.

151. For succession duty purposes, valuation of assets would be at market value but would have to include consideration of the potential income tax liability. This could include provision for refunds when the tax is paid.

152. Capital gains should be defined as investment income, which would mean the application of the 4 per cent surtax on foreign gains. This is a useful disincentive to invest outside the country and perhaps should be increased, since the growing need is for domestic development.

153. Capital cost allowances are the major source of business saving in Canada. The rate at which industry is allowed to replace and maintain plant and equipment is thus a key to private investment in capital goods.

154. From 1951-60, capital cost allowances provided more than 80 per cent of business saving. The sources

(excluding inventory adjustment) were \$8,100 million from undistributed income and \$33,500 million from capital cost allowances. Since dividends represented half of net profits, capital cost allowances were more than double net profits. (See Appendix IX.)

155. Accelerated capital cost allowances, by lowering tax liability, are thus a potent method for increasing savings. In 1960, for instance, private investment in new assets (excluding municipal, institutional and housing) was about \$4,000 million. Capital cost allowance was between \$500 million and \$750 million. If complete write-off of assets was allowed in the year of purchase, taxable income would have been reduced by more than \$3,000 million. Since corporation profits before taxes were \$3,200 million they would have been eliminated. However, the entire amount would have been available for corporate purposes as cash flow.

156. Obviously any increase in present capital cost allowances would sharply reduce government revenues. But what is claimed today cannot also be claimed tomorrow. In the long run the government receives the same revenue. The flexible instrument is when the corporation claims depreciation.

157. An increase in the capital cost allowance has two major effects:

- It provides corporations with a larger cash flow and thus with more money to invest;

- It provides more incentive to invest because of quicker recovery of capital.

158. The need to spur private investment and provide Canada with modern industry is one of the basic tenets of this submission. If accelerated depreciation is to be used two key factors must be considered:

1
2 - Every dollar added to business saving comes
3 from immediate government revenues;

4 - The incentive must be to invest in desirable
5 areas. We have defined this as areas producing
6 Canadian jobs, goods and technology.

7 159. It has been suggested in some quarters that
8 the best way to do this is to extend government loans
9 to the particular area the government wishes to
10 encourage. We feel that an open offer to all is
11 politically more desirable, administratively more
12 feasible and removes the unpalatable discretionary
13 authority involved in a loan program. Our proposal
14 balances what is financially feasible with the need
15 to spur specific types of investment.

16 160. Of total new fixed asset investment of \$8,200
17 million in 1960, \$2,713 million was in machinery and
18 equipment. Of this amount, nearly \$1,000 million was
19 in Class 8, depreciable at 20 per cent a year on a
20 reducing balance. The rest included purchases by the
21 three levels of government (not taxable); by railways
22 and electric, water and gas utilities; by pipelines,
23 telephone and telegraph companies and chemical pulp
24 companies; and purchases of ships, aircraft, vehicles,
25 etc. All are items that for depreciation purposes are
26 in other classes.

27 161. We recommend a special single write-off of
28 half the cost of new Class 8 machinery and equipment
29 purchases be allowed in addition to the regular 20
30 per cent allowance.

162. We do not want this benefit extended to
imported machinery and equipment unless it is used
to produce exports and cannot be produced in Canada.
Administratively this is difficult. We propose,
therefore, that the manufacturers sales tax exemption
be removed from imported machinery and equipment used
in production, unless it is used to produce exports and
cannot be produced in Canada. This is examined further
in the sales tax section.

1
2 163. The cost of this special allowance to
3 revenues would be 22½ per cent on applicable purchases
4 or about \$200 million in the first year, but revenues
5 would rapidly recover in later years. By the fourth
6 year losses would be nominal--less than 2 per cent
7 of government revenues--and should be more than offset
8 by increased revenue from economic growth, spurred
9 by the added incentive to invest. (See Appendix X.)
10 A higher rate of investment, which we would expect,
11 would produce a quick positive effect on revenues.
12 GNP would increase, productivity would increase and
13 profits would increase. Certainly any revenue loss
14 would be small compared with what will happen if the
15 economy fails to progress.

16 164. The gain to industry would be in the year
17 the special allowance was claimed, since future
18 write-offs would be reduced. In effect, the govern-
19 ment would grant an interest-free loan and take
20 repayment over an extended period.

21 165. Assuming an interest rate of 8 per cent for
22 business funds, the after-tax benefit would be worth
23 nearly 4 per cent of asset cost over five years and
24 almost 6 per cent over 10 years. If a company had to
25 borrow at higher rates, say 1 per cent a month, the
26 net saving would be 6 per cent after five years and
27 10 per cent after 10 years. To a company that could
28 not borrow money, the gain would be almost
29 immeasurable. (See Appendix XI.)

30 166. One of the main advantages to a special
capital cost allowance of this type is that it puts
both incentive and purchasing power in the hands of
business when it is most needed. When the economy
turns and counter-cyclical measures are required, the
special allowance could be cancelled. This would
cause a reduction in investment and increase
government revenues at a time a surplus is desirable.

157. The cost of this special allowance to
revenues would be 22½ per cent on applicable purchases
or about \$200 million in the first year, but revenues
would rapidly recover in later years. By the fourth
year losses would be nominal--less than 2 per cent
of Government revenues--and should be more than offset
by increased revenue from economic growth, earned
by the added incentive to invest. (See Appendix X.)
A higher rate of investment, which we would expect,
would produce a quick positive effect on revenues.
GDP would increase, productivity would increase and
profits would increase. Certainly any revenue loss
would be small compared with what will happen in the
economy due to progress.

158. The gain to industry would be in the year
the special allowance was obtained, since future
write-offs would be reduced. In effect, the govern-
ment would grant an interest-free loan and take
repayment over an extended period.

159. Assuming an interest rate of 2 per cent for
business funds, the after-tax benefit would be worth
nearly 4 per cent of sales cost over five years and
almost 6 per cent over 10 years. If a company had to
borrow at higher rates, say 1 per cent a month, the
net saving would be 3 per cent after five years and
10 per cent after 10 years. If a company had to
not borrow money, the gain would be almost
unmeasurable. (See Appendix XI.)

160. One of the main advantages of a special
capital cost allowance of this type is that it has
both incentive and demonstrative power in the form of
practices when it is most needed. When the economy
turns and counter-revolutionary measures are required, the
special allowance could be cancelled. That would
cause a reduction in investment and increase
Government revenues at a time a surplus is desirable.

167. In the first year, our overall program would balance revenue gains and losses. The government would use this time to plan its social capital program. In later years, corporate tax revenues would at least return to what they would have been and our overall program would produce net gains in government revenues. These gains would finance the social capital program.

PROVINCIAL REVENUES

168. At this stage we examine the effects of certain recommendations on provincial revenues.

169. Our overall tax program would balance revenue gains and losses at a gross level, that is, before the provinces received their share of corporate and personal taxes. Since the provinces would not receive revenue from an increase in the manufacturers sales tax, an adjustment would be needed to balance the losses they would suffer in the corporate and personal fields.

170. The provincial share of personal tax revenues is 16 per cent, rising to 20 per cent by 1966. Our lower rates would decrease gross revenues by \$175 million while taxation of capital gains would restore \$100 million, for a net drop in gross revenues of \$75 million.

171. The provincial corporation tax is 11 per cent for Ontario and Quebec, 9 per cent for the others. The special capital cost allowance would decrease gross revenues by \$200 million the first year, of which the provincial share would be about \$46 million. As explained previously, this loss would decrease rapidly.

172. Without any adjustment to the provinces, federal revenue gains would exceed losses because the sales tax increase would not be shared. This net gain

1
2 could be redirected to maintain provincial revenues
3 by increasing the provinces' personal tax share. For
4 instance, if all our recommendations were adopted
5 this year, increasing the provincial share of personal
6 tax revenues to 20 per cent immediately would maintain
7 their revenues. We suggest, however, some provincial
8 reduction would be reasonable on two grounds:

9 - The recommendations aim at increasing corporate
10 profits and personal income faster than under the
11 present structure--provincial revenues would gain
12 accordingly;

13 - The federal government's social capital program
14 would largely go to areas now pressing for provincial
15 funds, and would ease this pressure from what it
16 would otherwise be. Such investments in social
17 capital have constituted a major drain on the
18 provinces. Ontario, for instance, expects to spend
19 one-third of its 1962-63 budget on education, three
20 times what it spent only five years ago.

21 MANUFACTURERS SALES TAX

22 173. An increase in the manufacturers sales tax
23 completes our proposals.

24 174. Increased government expenditures have largely
25 been due to social welfare payments. This is quite
26 proper. But once a society has attained a minimum
27 standard of living, it is reasonable to tax
28 consumption to provide government with revenues to
29 meet remaining needs of social welfare and social
30 balance. Canada's average per capita real income has
risen more than 45 per cent since 1929. By any
criteria we enjoy a reasonable standard of living.
The sales tax thus becomes an obvious solution to the
pressing need to provide incentives for desirable
private investment and funds for government
investment in social capital.

175. "The relation of the sales tax to the problem of social balance is admirably direct. The community is affluent in privately produced goods. It is poor in public services. The obvious solution is to tax the former to provide the latter--by making private goods more expensive, public goods are made more abundant."²⁴

176. Our proposals attempt to modify this principle. Reducing personal tax rates should offset the increased cost of consumption so consumption expenditures are maintained. But we emphasize that action is required. If sacrifice is necessary, it should be in consumption for the sake of investment.

177. The manufacturers sales tax, as a method of providing the needed balance and incentive, has two great advantages:

- It presents no additional administrative difficulties, since it would involve an increase in an existing tax with which the nation has had considerable experience;

- It is politically acceptable to business, having been commended by several business groups. Granted that this has usually been done while espousing the sales tax as an alternative to other taxes, it emphasizes that the sales tax does not damage incentives or interfere with production.

178. The 11 per cent manufacturers sales tax includes 3 per cent for old age assistance. Each 1 per cent raises about \$100 million. The source of sales tax revenue is 60 per cent from consumer goods, 30 per cent from industrial goods and 10 per cent from sales to government (for items such as defence).²⁵ Discounting government transfers, a 3 per cent increase would add \$270 million in revenues.

179. The portion falling on industrial goods would be \$90 million, less than 3 per cent of corporate profits. Since the tax liability would be deductible from taxable income, net cost to industry

1
2
3 would be about \$45 million. A substantial portion of
4 the tax falling on industry is believed to be shifted,
5 but we feel it would be reasonable to expect
6 industry to absorb any increase under our program
7 for these reasons:

8 - The special capital cost allowance should spur
9 productivity and increase business profits;

10 - Added government investment in social capital
11 would aid productivity increases, for instance by
12 providing a better-skilled labor force;

13 - Any tax increase should be accompanied by a
14 government campaign to convince the nation of the
15 need for stable prices.

16 180. In any case, export industries and their
17 suppliers would remain exempt so foreign trade would
18 not be affected.

19 181. The portion of the increase on consumer goods
20 would be \$180 million, or two-thirds of 1 per cent of
21 personal income. We would assume complete shifting of
22 this amount and thus retail price increases would be
23 2 per cent. Basic items like food, shelter, fuel and
24 utilities, which make up between 63 and 70 per cent
25 of consumer expenditures, would continue to be exempt.

26 182. The result, to an average taxpayer with \$5,000
27 income, would be increased consumption costs of \$37 a
28 year and lower income taxes of \$45, or an \$8 increase
29 in disposable income. The increase in disposable
30 income would rise with larger incomes.

183. The small added burden would fall, in general,
on incomes of less than \$5,000. Consumption costs
would increase \$7 a year at \$1,000 income, where there
is no income tax. The maximum added cost, depending
on status, would be from \$20 to \$25 in the brackets
from \$3,000 to \$5,000 of income.

would be about \$45 million. A substantial portion of
the tax falling on industry is believed to be shifted,
but we feel it would be reasonable to expect
industry to absorb any increase under our program
for these reasons:
The special capital cost allowance should spur
productivity and increase business profits;
- Added government investment in social capital
would aid productivity increases, for instance by
providing a better-trained labor force;
- Any tax increase should be accompanied by a
government campaign to convince the nation of the
need for stable prices.
180. In any case, export industries and their
suppliers would remain exempt so foreign trade would
not be affected.
181. The portion of the increase on consumer goods
would be \$180 million, or two-thirds of 1 per cent of
personal income. We would assume complete shifting of
this amount and thus retail price increases would be
utilized, which make up between 65 and 70 per cent
of consumer expenditures, would contribute to be around
182. The result, to an average taxpayer with \$5,000
income, would be increased consumption costs of \$3.75 a
year and lower income taxes of 14¢, or an 18.1 percent
in disposable income. The increase in disposable
income would rise with larger incomes.
183. The small added burden would fall, in general,
on incomes of less than \$5,000. Consumption costs
would increase \$3 a year at \$1,000 income, about 11.1
to no income tax. The maximum added cost, depending
on status, would be from \$35 to \$65 on the income
from \$5,000 to \$6,000 of income.

184. It might be argued that this structure would be regressive. We contend that the low and medium income groups do not bear a reasonable proportion of the cost of extensive government services and in particular a fair share of the growing social welfare costs. Appendix VI shows the favorable position of a Canadian taxpayer at low levels compared with U.S. and British counterparts. The added cost to this taxpayer every month would only be 60 cents to \$2, not an unreasonable burden. Except at the lowest bracket, the individual could still obtain a net gain by cutting his consumption, since personal tax rates would be lower. The limited data on consumer behavior in Canada, however, suggests such a shift would be unlikely.

185. If some relief was deemed essential, exemptions could be broadened. The following items, now taxable, if exempt would make the sales tax more progressive:

- Drugs used in prescriptions and other medicines; tea, coffee and prepared beverages; margarine; cooking oils, shortening and baking soda; many prepared deserts, icing, jello and cake mixes; chocolate, olives and pickles; spices, flavorings and extracts; candy and nuts; some building materials--hardware, pipe fittings, some types of cupboards, asphalt composition.

186. Appendix VII sets out the net results on various classes of taxpayers from the proposed changes in sales and personal tax rates.

187. The net effect of our proposals would almost balance the portions of federal and provincial revenues coming from income and consumption taxes. In 1962 they will receive 47 per cent from income and 40 per cent from consumption. This would change to 45 per cent and 43 per cent respectively, of increased revenues.

184. It might be argued that this assumption would be aggressive. We contend that the low and medium income groups do not bear a reasonable proportion of the cost of extensive Government services and in particular a fair share of the growing social welfare costs. Appendix V shows the favorable position of a Canadian taxpayer at low levels compared with U.S. and British counterparts. The added cost to this taxpayer every month would only be 80 cents to \$2, not an unreasonable burden. Except at the lowest bracket, the individual would still obtain a net gain by utilizing his consumption, since personal tax rates would be lower. The limited data on consumer behavior in Canada, however, suggests such a shift would be unhelpful.

185. If some relief was deemed essential, exemptions could be provided. The following items, new taxable, if exempt would make the sales tax more progressive:

- drugs used in prescriptions and other medicals;
- food, often and prepared beverages; margarine cooking oil; shortening and baking soda; soap; prepared cereals; toilet, toilet and coffee; chocolate;
- clothes and practical shoes; travel and maintenance;
- energy and heat; some building materials--hardware;
- large fittings, some types of equipment; asphalt

corporation.

186. Appendix VII sets out the net results on various classes of taxpayers from the proposed changes in sales and personal tax rates.

187. The net effect of the proposals would almost balance the positions of federal and provincial revenues coming from income and consumption taxes. In 1962 they will receive 44 per cent from income tax and 43 per cent and 43 per cent respectively, or

188. We would also use the sales tax to offset the special capital cost allowance when it is applied to imported machinery and equipment not used to produce exports or that could be produced in Canada. Such imports are now exempt from sales tax if they are used directly in production.

189. We do not want to provide any added incentive to invest in such imports, but there are too many administrative difficulties involved to limit the special capital cost allowance. Making these imports liable to the sales tax would be an ample counterweight.

190. Total imports of machinery and equipment in 1960 were \$1,000 million. Probably \$350 million would become subject to sales tax, adding about \$40 million in revenues for purposes of our program. Thus the net increase in sales tax revenues under our program, after deducting inter-government transfers, would be about \$300 million.

191. All of which is respectfully submitted for your consideration.

APPENDIX II Inner Reserves

The first specific information about inner reserves came in 1954 when Hon. Douglas Abbott, Minister of Finance, filed Exhibit 31 with the House of Commons Standing Committee on Banking and Commerce. It showed that inner reserves included all unpublished reserves other than depreciation reserves on premises. These unpublished reserves included:

Tax-paid reserve: The portion on which income taxes had been paid;

Specific reserve: Specific reserves required to reduce specific assets to estimated realizable value. This reserve was tax-free.

General loss or contingency reserve: Remaining inner reserves came within this classification, and were also tax-free. The reserve was limited, however, to certain percentages of various bank assets--2% of other than short-term securities of the Canadian, U.S. or U.K. governments, 3% of provincial securities and 5% of loans, letters of credit, net foreign exchange position and other investments.

The exhibit revealed for the first time the permitted maximum of general reserve for all banks; at the 1953 year-ends it was \$319.7 million. It was also learned that no individual bank was at its permitted maximum, although some had reached the limit in recent years. The Royal Bank reported at its 1954 year-end that its tax-free inner reserves were at the maximum allowed.

ANNEX I Research and Development 1959

Industry	1.08	0.41	U.S.

ANNEX II Labor Reserves

The first specific provision about labor reserves

came in 1954 when Hon. Douglas Abbott, Minister of Finance, filed Exhibit 11 with the House of Commons Committee on Banking and Commerce. It showed that labor

depreciation reserves of various kinds were established

reserves included:

Tax-paid reserves: The portion on which income taxes

had been paid.

Specific reserves: Specific reserves applied to

This reserve was tax-free.

General loss or contingency reserve: Reserve for

reserves came within that classification, and was also

tax-free. The reserve was limited, however, to certain

percentages of various bank assets--1% of other than assets, 2% of deposits of the Canadian, U.S., or U.K. Government,

2% of provincial securities and 2% of loans; 1% of

credit, not foreign exchange position and other

The exhibit revealed for the first time the permitted

maximum of general reserve for all banks, as the 1954

year-ends it was \$11.7 million. It was also found that

no national bank was at its permitted maximum, although some had reached the limit in recent years. The total bank

reported at its 1954 year-ends that the reserves

reserves were at the maximum allowed.

1
2 The \$319.7 million, it must be noted, did not include
3 specific or tax-paid inner reserves.

4 Changes have been made since 1954 in the method used
5 to calculate allowable tax-free inner reserves. While
6 the government does not share the information with the
7 public, it is believed the present limit is just under
8 5% of related assets and covers both specific and general
9 reserves. We understand reserves are no longer permitted
10 against federal and provincial securities.

11 In recent years all banks have made transfers from
12 inner reserves to shareholders' equity on which taxes were
13 paid. At least three of the five major banks also made
14 transfers from tax-paid reserves. It is reasonable to
15 assume the banks would not have transferred reserves
16 involving tax liability unless the tax-free inner reserves
17 were at or near the maximum. Excluding federal and
18 provincial securities the applicable assets grew from about
19 \$5,000 million in 1953 to more than \$8,500 million in 1960.
20 This would indicate the permitted maximum of tax-free
21 inner reserves would exceed \$400 million.

22 We tested this computation of tax-free inner reserves
23 in two ways:

24 - We compared actual tax payments since 1953 with
25 declared net profits and transfers in and out of reserve
26 accounts as reported by the Bank of Canada;

27 - We took the 1953 maximum and adjusted it for the
28 estimated specific reserve and for transfers in and out
29 of inner reserves in succeeding years. Actual losses,
30 using the reported 15- and 25-year averages, were deducted.
Individual bank annual reports assisted the analysis.

We assume the 1953 level--including specific reserves--
was between \$325-350 million. Subsequent transfers to inner
reserves have exceeded transfers out of inner reserves,
excluding transfers from tax-paid reserves, and actual
losses. Thus we estimate tax-free inner reserves at from
\$350-400 million. If only three times the average annual
loss experience or specific reserves was allowed tax-
exempt status, at least \$300 million would thus be taxable.

The \$219.7 million, it must be noted, did not include

Changes have been made since 1954 in the method used to calculate allowable tax-free inner reserves. While the Government does not share the information with the public, it is believed the present limit is just under 2% of related assets and covers both specific and general reserves. We understand reserves are no longer permitted against federal and provincial securities.

In recent years all banks have made transfers from inner reserves to shareholders' equity on which taxes were paid. At least three of the five major banks also made transfers from tax-paid reserves. It is reasonable to assume the banks would not have transferred reserves involving tax liability unless the tax-free inner reserves were at or near the maximum. Excluding federal and provincial securities the applicable assets grew from about \$2,000 million in 1953 to more than \$8,500 million in 1960. This would indicate the permitted maximum of tax-free inner reserves would exceed \$400 million.

We tested this computation of tax-free inner reserves in two ways:

- We compared actual tax payments since 1957 with declared net profits and transfers in and out of reserve accounts as reported by the Bank of Canada;
 - We took the 1953 maximum and adjusted it for the estimated specific reserve and for transfers in and out of inner reserves in succeeding years. Actual losses, using the reported 15- and 25-year averages, were deducted. Individual bank annual reports assisted the analysis.
- We assume the 1953 level--including specific reserves--was between \$325-350 million. Subsequent transfers to inner reserves have exceeded transfers out of inner reserves, and excluding transfers from tax-paid reserves, and actual losses. Thus we estimate tax-free inner reserves at from \$350-400 million. If only three times the average annual loss experience or specific reserves are allowed tax-exempt status, at least \$300 million would thus be available.

3,550-4,049	34.3	37.4	79	28
4,050-4,549	35.0	38.6	77	31
4,550-5,049	35.0	38.0	67	38
Over 5,050	34.4	38.0	48	48

1 Includes major consumer items only. (See House of Commons)

2 Includes all taxable items but does not include universal

3 Assumes complete shifting of tax and that 3% at manu-

facturers' level equals 2% at retail level. (See Que.)

Note: Percentage of family income spent on items subject to manufacturers sales tax is based on the Dominion Bureau of Statistics 1947-48 survey. Table assumes a 2% increase in sales tax, personal tax rates according to those proposed in Appendix V.

APPENDIX VIII Capital Gains--U.S. Revenues

	1959	1958	1957	1956
	(millions)			
Personal returns with reported capital gains	4.0	3.5	2.9	3.15
Net capital gains ¹	6,797	4,879	4,128	4,991
Losses allowed ²	520	550	640	440
Tax status of net gains:				
Non-taxable	680		400	
Normal tax	4,050		2,500	
Alternative tax ³	2,050		1,240	

¹ After deduction of losses from gains.

² Losses claimed as deduction from ordinary income because they exceeded capital gains in the year. The U.S. limits this deduction to \$1,000 and only allows loss carry-forward for five years.

³ The effective tax on capital gains is limited to 25%.

Source: U.S. Treasury Department, Statistical Study of Income, Individual Income Tax Returns, 1955-59.

Note: In 1959 U.S. revenues from taxation of capital gains were more than \$2,000 million. To obtain our estimate of Canadian capital gains we adjusted for the relative sizes of the economies, for unlimited loss carry-forward, for valuation of estate assets at original cost (U.S. values estate assets at market and does not tax the estate on capital gains), and for the fact that many property sales in the U.S. treated as capital gains would already be taxed in Canada as ordinary income. We also allowed for more conservative investment tendencies by Canadians.

APPENDIX IX Sources of Business Saving

SUBMISSION

TO THE

CANADIAN ROYAL COMMISSION ON BANKING AND FINANCE

MARCH, 1962

By: A. H. CAMERON

INTRODUCTION

GENERAL REMARKS AND RECOMMENDATIONS

(1) This submission is not a comprehensive review of the financial system, but concentrates on the Bank of Canada, the Finance Department and the Bond market. My experience has primarily been in the government bond market, which has lead to some familiarity with commercial and central banking, capital flows and foreign exchange. I have been fortunate in acquiring some knowledge of the mechanism and personalities, and philosophy, of the United States Treasury, Federal Reserve Board, and U.S. bond market, and have also been privileged to visit half a dozen other central banks. Thus, in looking at our situation, I would make comparisons with the mechanism and philosophies extant in other countries.

(2) Most of the recommendations to follow are not new, for I have made them piecemeal over the past five years or so. They are my own views, and do not purport to be, except by coincidence, those of the investment industry.

(3) I believe that Canada suffers from maladjustments in its financial system, perhaps new to us, differing in detail but perhaps not in basic cause from those experienced elsewhere at other times.

(4) Fundamentally I blame the Keynesian idea that full employment can be restored by tinkering with the monetary system and through large government deficits, during times of higher than desirable unemployment. ^(F) I believe that this is proving increasingly difficult, after the wartime monetary expansion, the postwar rise in prices, the burgeoning of large scale production capabilities elsewhere, and a growing general realization that democratic governments indulge in actions which cause long-run deterioration in the value of money.

(5) Someone should enunciate a "Gresham's Law of Politicians", to wit that "those who would make money bad tend to drive out those who would make it less bad". It has become a political credo that to secure and retain office it is necessary to increase public spending, taking a larger and larger share of Gross National Product through taxation (and more through watering the money supply), distributing more and more to the voters at large. ^(F) This modern interpretation of the Marxist "From each according to his abilities, to each according to his needs", is practiced by many political parties which shun the Marxist label.

INTRODUCTION

GENERAL REMARKS AND RECOMMENDATIONS

This submission is not a comprehensive review of the financial system, but concentrates on the Bank of Canada, the Finance Department and the Bond Market. My experience has primarily been in the government bond market, which has led to some familiarity with commercial and central banking, capital flows and foreign exchange. I have been fortunate in acquiring some knowledge of the mechanism and personalities, and philosophy, of the United States Treasury, Federal Reserve Board, and U.S. bond market, and have also been privileged to visit half a dozen other central banks. Thus, in looking at our situation, I would make comparisons with the mechanism and philosophies extant in other countries. Most of the recommendations to follow are not new, for I have made them piecemeal over the past five years or so. They are my own views, and do not purport to be, except by coincidence, those of the investment industry.

I believe that Canada suffers from maladjustments in its financial system, perhaps new to us, differing in detail but perhaps not in basic causes from those experienced elsewhere at other times. Fundamentally I blame the Keynesian idea that full employment can be restored by tinkering with the monetary system and through large Government deficits, during times of higher than desirable unemployment. I believe that this is proving increasingly difficult, after the wartime monetary expansion, the postwar rise in prices, the outflowing of large scale production capability, its awareness, and a growing general realization that monetary governments indulge in actions which cause long-run deterioration in the value of money. Someone should enunciate a "Greenback" law of politicians, to wit: that "those who would make money had better be sure to leave out those who would make it less so". It has become a political credo that to become and remain efficient it is necessary to increase public spending, borrow a larger and larger amount of Gross National Product through taxation (and more through printing the money supply), distributing more and more to the voters at large. (2) This is the interpretation of the Marxist "from each according to his abilities, to each according to his needs", as practiced by many political parties which abuse the Marxist label.

1
2
3 (6) I believe Canada is passing through such a stage, which will last until
4 people fear it may destroy the system which once gave us the world's second
5 highest living standard, for many democracies have decayed this way before.
6 Maybe the competition from other countries, such as the Common Market
7 members, which earlier experienced the something-for-nothing, wasting currency
8 disease, will shock us in time. (F) Maybe the cold bath will be a flight of
9 capital, or a breakdown in the financial system, forcing the state to show
10 its true colors -- not the benevolent welfare state but rather a regimented
11 savings program. (F)

12 (7) Our financial system grew in the image of England, during the British
13 century of stable or declining prices, sound money, the Gold Standard, and
14 low taxes. After nearly fifty years of wasting money, two world wars,
15 growing taxation, and the increasing political power of both the debtor class
16 and those who would grasp the public teat, the system is showing a few cracks.

17 (8) These cracks, present for years perhaps, were concealed during the
18 last War by a single minded concentration on Victory, by the rationing of
19 goods, because inflation was concealed or soft-pedalled, because nervous
20 investors were promised pegged bond prices, because the private sector's
21 demands for money were small. The lender felt a community of interest with
22 the borrower (the Government), forgetting the obvious, that the interests of
23 savers or lenders and those of borrowers usually differ. In the early post-
24 war years governmental surpluses, plus the willingness of Central Banks to
25 buy in bonds at par, accommodated public dis-investment and provided the dis-
26 investor in Government issues with the money to invest in the private sector.
27 After 1950, government bonds began to sell at discounts, while those whose
28 prime need was liquidity discovered that in practice it was not provided by
29 long bonds which could sell at ten point losses.

30 (9) When these new attitudes had become established, we began in 1957 a
31 new era of deficit finance, involving substantial monetary expansion. The
32 public, after losing half the buying power of money in one generation, (F)
33 became reluctant to buy long term government paper; bond price declines
34 (from tight money periods) disorganized markets further, and the cracks in
35 the financial structure appeared. The Conversion Loan of 1958 revealed
36 many of them, and must be continually cited.

37 (10) I am critical of the shortcomings revealed, many of them the result
38 of conflicts of interest within the Central Bank and the financial mechanism,

I believe Canada is passing through such a stage, which will last until people fear it may destroy the system which once gave us the world's second highest living standards. For many democracies have decayed since war began. Maybe the competition from other countries, such as the Common Market members, which earlier experienced the something-for-nothing, wasting currency disease, will shock us in time. (P) Maybe the cold path will be a flight of capital, or a breakdown in the financial system, forcing the state to show its true colors -- not the benevolent welfare state but rather a reorganized Our financial system grew in the wake of England, during the British century of stable or declining prices, sound money, the Gold Standard, and low taxes. After nearly fifty years of sound money, two world wars, growing taxation, and the increasing political power of both the labor class and those who would grasp the public purse, the system is showing a few cracks. These cracks, present for years perhaps, were concealed during the last War by a single minded concentration on Victory, by the rationing of goods, because inflation was concealed or self-peddled, because nervous investors were promised pegged bond prices, because the private sector's demands for money were small. The lender felt a community of interest with the borrower (the Government), forgetting the obvious, that the interests of savers or lenders and those of borrowers usually differ. In the early post-war years government's surprises, plus the willingness of Central Banks to buy in funds at par, accommodated public dis-investment and provided the investor in Government issues with the money to invest in the private sector. After 1950, government bonds began to sell at discounts, while those whose prime need was liquidity discovered that in practice it was not provided by long bonds which could sell at ten point losses. When these new attitudes had become established, we began in 1957 a new era of deficit finance, involving substantial monetary expansion. The public, after losing half the buying power of money in one generation, became reluctant to buy long term government paper; bond rates rose (from tight money periods) disorganized markets further, and the ruin in the financial structure appeared. The Conversion Loan of 1958 revealed many of them, and must be continually cited. I am critical of the short-sighted reveals, many of them the result of conflicts of interest within the Central Bank and the financial world.

1
2
3 but these are not the causes of the disease. The cause, I believe, is the
4 tendency of government to encroach on our lives as both Robin Hood and Santa
5 Claus, to water the money supply, and to stifle the free market system when
6 it serves them poorly, by jerry-built, ad hoc, piecemeal attempts to direct
7 investment, with unsuspected consequences in other areas.

8 (11) I believe the Bank of Canada has tended to regard the bond market
9 as a utensil created primarily for the benefit of themselves and the
10 Government. They have manipulated it, when it suited their purpose, even
11 on one occasion effectively capturing it for two months, and they have
12 become the dominant factor, as principal and government agent directly, and
13 through their pressures on dealers and banks indirectly. Markets so dominat-
14 ed by one participant tend to atrophy, eventually serving the dominant
15 participant poorly as they lose appeal to other participants. From the
16 many activities of the Bank, in regulating money supply, marketing govern-
17 ment issues, investing Trust Funds, making rules for the "money market",
18 regulating banks through moral suasion, I sense that their concept of a free
19 market differs from that of most institutional and individual investors. I
20 do not get this feeling in the Federal Reserve Board of the United States
21 which met many similar problems without the same yen to dominate and
22 manipulate the market.

23 (12) My recommendations are but repairs which may enable the financial
24 system to function more satisfactorily until Governments change their ways,
25 either by ceasing to do more and more for the people, or by outright
26 regimentation. These changes may occur through a public awakening, through
27 inflationary pressures ending in a deflation as high priced export goods
28 cease to sell, while domestic industries are idled by cheaper imports.

29 (13) These repairs are more necessary now than in previous, earlier eras.
30 In particular I would reduce the grip of the Bank of Canada on government
finance and on the bond market, so that the market might function more
freely, with less official pressure, or influence.

I would group these recommendations:

(14) BANK OF CANADA

1. The Bank Board should consist of a few almost full time persons,
possessing a working knowledge of finance and economics, capable of
giving the Governor expert advice.
2. The Bank of Canada Act should specify the Governor's tenure, pension,
grounds for removal, etc.

but these are not the causes of the disease. The cause, I believe, is the tendency of government to encourage on one hand as both Robert Hurd and Jants Olaus, to water the money supply, and to stifle the free market system when it serves them poorly, by Jerry-built, ad hoc, piecemeal attempts to direct investment, with unanticipated consequences in other areas.

I believe the Bank of Canada has tended to regard the bond market as a utopian created primarily for the benefit of themselves and the Government. They have manipulated it, when it suited their purposes, even on one occasion effectively constructing it for two months, and they have become the dominant factor, as principal and government agent directly, and through their pressures on dealers and banks indirectly. Markets so controlled by one participant tend to atrophy, eventually coming to resemble participant poorly as they lose appeal to other participants. From the many activities of the Bank, in regulating money supply, maintaining interest rates, investing Trust Funds, making rules for the "money market", regulating banks through moral suasion, I sense that such a concept of a free market differs from that of most institutional and individual investors. do not get this feeling in the Federal Reserve Board of the United States which met many similar problems without the same fear to forecast and manipulate the market.

My recommendations are but reforms which may enable the financial system to function more satisfactorily until government changes when necessary, either by ceasing to do more and more for the people, or by encouraging experimentation. These changes may occur through a public movement, through inflationary pressures ending in a deflation as high priced export goods cease to sell, while domestic industries are forced to export labor. These reforms are more necessary now than in previous, earlier years. In particular I would reduce the grip of the Bank of Canada on government finance and on the bond market, so that the market might function more freely, with less official pressure, or influence.

I would know these recommendations.

BANK OF CANADA

1. The Bank Board should consist of a few almost full time persons, possessing a working knowledge of finance and economics, capable of giving the Governor expert advice.

2. The Bank Board should be responsible for removal, etc.

- 1
- 2
3. The Act should also state that the Bank's policy is that of the
- 3 Government, with the Government being responsible for such policy
- 4 to Parliament.
- 4.
- 5 The Bank merits increased powers over banks and other areas of finance,
- 6 but these should be specified as to area in the Act, and the Bank's
- 7 right to acquire additional power extra-legally, through pressure or
- 8 moral suasion, should be severely curtailed.
5. The access by Bank of Canada to information in the hands of the
- 8 Inspector General of Banks should be with the proviso that there should
- 9 be no conflict with Section 67 of the Bank Act (the secrecy provision),
- 10 nor should the Bank of Canada use information so obtained to discrimin-
- 11 ate against any chartered bank or customer.
6. "Money Market" should be formally recognized in the Act, open to all
- 12 security dealers on a voluntary, even occasional, basis, with specified
- 13 margin requirements, and no opportunity for discrimination, or the
- 14 control of dealers' inventory items.
7. Bank of Canada should be permitted to replace bills (or run them off)
- 15 at the weekly auction, but not to add to its holdings beyond this
- 16 replacement except through the open market.
8. The Bank should be audited by the Auditor General, so that the record
- 17 will show discriminatory deals, or any use of funds contrary to public
- 18 interest.
9. The Governor's Annual Report should be examined and discussed every
- 19 year by Parliament or a Committee thereof.
- 20
10. The Bank should again be obliged to arbitrarily set a Bank Rate.
- 21
11. The conflict of interest, inherent in having monetary policy and debt
- 22 management functions concentrated in the Bank, should be minimized by
- 23 diminishing the Bank's influence in the debt management area, and by
- 24 restricting the Bank's monetary policy open market operations to
- 25 short term issues.
- 26
12. The triple conflict of interest of having the Bank (or Finance)
- 27 represented on the investment committees of Trust Funds should be
- 28 eliminated.
- 29
13. Any present or future "agreements" between Bank of Canada and
- 30 chartered banks, or anyone else, should be examined by Parliament, and
- either legalized or voided, and these should never be kept secret
- even during the period of negotiation, for secrecy can harm those
- kept in ignorance of the negotiations.

The Act should also state that the Bank's policy is that of the Government, with the Government being responsible for such policy.

The Bank merits increased powers over banks and other areas of finance, but these should be specified as to areas in the Act, and the Bank's right to acquire additional power extra-legally, through pressure or moral suasion, should be severely curtailed.

The access by Bank of Canada to information in the hands of the Inspector General of Banks should be with the proviso that there should be no conflict with Section 67 of the Bank Act (the secrecy provision), nor should the Bank of Canada use information so obtained to discriminate against any chartered bank or customer.

"Money market" should be formally recognized in the Act, open to all security dealers on a voluntary, even occasional, basis, with specified margin requirements, and no opportunity for discrimination, or the control of dealers' inventory items.

Bank of Canada should be permitted to replace bills (or run them off) at the weekly auction, but not to add to the holdings beyond this replacement except through the open market.

The Bank should be audited by the Auditor General, so that the record will show discriminatory deals, or any use of funds contrary to public interest.

The Governor's Annual Report should be examined and discussed every year by Parliament or a Committee thereof.

The Bank should again be obliged to apply to set a Bank Note.

The conflict of interest, inherent in having monetary policy and other management functions concentrated in the Bank, should be minimized by diminishing the Bank's influence in the debt management area, and by restricting the Bank's monetary policy open market operations to the triple conflict of interest of having the Bank (or Finance) represented on the investment committees of Trust Funds should be eliminated.

Any present or future "agreements" between Bank of Canada and chartered banks, or anyone else, should be examined by Parliament, and either legalized or voided, and these should never be kept secret even during the period of negotiation, for secrecy can mean these kept in ignorance of the non-negotiable.

THE FINANCE DEPARTMENT

- (15) 1. The Minister of Finance's job should be split, to reduce his responsibilities in some areas, and so that he will be able to devote more time to the public debt. Perhaps there should be an additional Deputy Minister, who could concentrate on debt matters.
2. The Finance Department should have a well-staffed Debt Management Division, to research for and to carry out the advice of, a Public Debt Commission, to be appointed outside civil service salary scales. There should be a marketing expert in the Division or on the Public Debt Commission.
3. A "Target" deficit or surplus should be a feature of every Speech from the Throne, with the details coming later in the regular budget.

THE BOND MARKET

- (16) 1. The "Money Market" should be specifically legalized, opened up, and freed from any undue influence asserted by Bank of Canada. The establishment of margin requirements, and the non-discriminatory accommodation of dealers should be enough, without the Bank having any power to suggest the composition of inventories. (This duplicates suggestion #5 re Bank of Canada).
2. The Long term bond market should be given a chance at rehabilitation, by freeing it from the bear-hug of official influence. (Mainly the Bank of Canada, in one guise or another). The Bank's dealings in the market should be restricted to money market issues, while Government Trust Funds should not deal in market issues, or should have Boards free from Bank or Finance influence. Let the Bank cease being the underwriter, and re-seller of new government issues.
3. Government bond issues should be offered at a net price to all comers, without commission, with perhaps guaranteed full allotment to small investors, and a publicly announced flat percentage allotment to others such as banks, institutions and dealers. This should free dealers from the conflict of interest inherent in possessing a certain unwritten but predictable allotment of any new issue, during the Bank's pleasure. The conflict of interest is that, while in a preferred position on the Bank list, dealers may view themselves as primarily government agents, to the detriment of the interests of investors.
4. The Commission should consider the growing share of the National debt represented by Savings bonds. This poses a redemption threat, which I believe should be welcomed, not deplored, since it gives investors a

1. The Minister of Finance's job should be split, to reduce his responsibility in some areas, and so that he will be able to devote more time to the public debt. Perhaps there should be an additional Deputy Minister, who could concentrate on debt matters.
2. The Finance Department should have a well-staffed Debt Management Division, to research for and to carry out the advice of a Public Debt Commission, to be appointed outside civil service salary scales. There should be a marketing expert in the Division or on the Public Debt Commission.
3. A "Target" deficit or surplus should be a feature of every Speech from the Throne, with the details coming later in the regular budget.

Nethercut & Young

Toronto, Ontario

A1040

collective power of discipline over government, just as demand deposits encourage rectitude among bankers.

5. Insurance companies should be able to trade Canada issues for other Canada issues, adding on to the price of the purchase any "book loss" they must incur by selling the original investment, rather than being obliged to charge the loss to current year's earnings. This would broaden the market, and permit investment judgment to predominate over book-keeping considerations.

FOOTNOTES.

In addition to certain appendix material, I have added a number of footnotes, which will bear numbers corresponding to those of the paragraphs to which they refer. Instead of these being at the foot of each page, they will be grouped at the end.

A. H. CAMERON.

MAIN BRIEF

1.

THE BANK OF CANADA

BOARD OF DIRECTORS

(18)

Arguments that the Bank of Canada Board (meeting infrequently, dominated by the Governor's veto power) possessed little authority, were summarized in the February, 1961 Journal of the Canadian Political Science Association by Professor Scott Gordon of Carleton University (See pages 11-12 in attached reprint). Though most of the Board's history supports this contention, the events of 1961 show that the Board could also be the creature of the Finance Minister, in endeavoring to obtain the Governor's resignation.

(19)

Either subservient condition questions the utility of the Board as presently appointed. There is little indication that the Board could ever brake the Governor, without the aid of the Minister, nor did it serve the Minister in securing the Governor's resignation, without the aid of a bill in both Houses, plus a Senate enquiry.

(20)

Since 1936 a few directors, notably J. T. Bryden, and the late Edgar Tarr, Peter McQueen and Thomas Bradshaw, were well qualified by experience and background to give the Governor useful financial advice, but geography and political background seemed to govern most appointments. I suspect that infrequent Board meetings may have seen the Governor give the Board his views on the economy, rather than the reverse.

(21)

I believe a Board meeting in the Maritimes coincided with the planning of the ill-fated 1958 Conversion Loan, the largest financial operation in years. If the Commission ascertained from the Board's minutes whether the Board were told of this coming program, and if so, whether it tendered any advice, the Commission might determine what value the Governor placed upon the Board's advice. The Bank records should show the date of the meeting, and if the printing orders, etc. were coincident.

(22)

Further, Governors might derive real aid and advice from a small Board, perhaps four or five people available in Ottawa two or more days per week -- people with practical backgrounds in finance and economics, even if we must junk the geographical representation principle, plus the ban on bankers which may now bar our most knowledgeable money-men.

MAIN PRINCIPLE

THE BANK

BOARD OF DIRECTORS

Assurance that the Bank of Canada Board (meeting infrequently, dominated by the Governor's veto power) possessed little authority, were summarized in the February, 1961 Journal of the Canadian Political Science Association by Professor Scott Gordon of Carleton University (see pages 11-12 in attached reprint). Though most of the Board's history supports this contention, the events of 1961 show that the Board could also be the creature of the Finance Minister, in order to obtain the Governor's resignation.

Either the present constitution questions the utility of the Board as presently constituted. There is little indication that the Board could ever break the Governor, without the aid of the Minister, nor did it save the Minister in securing the Governor's resignation, without the aid of a bill in both Houses, give a Senate enquiry.

Since 1935 a few directors, notably J. T. Bryden, and the late Edgar Lear, Peter McGowan and Thomas Bradshaw, were well qualified by experience and background to give the Governor useful financial advice, but geography and political background seemed to govern most appointments. I suspect that in frequent Board meetings may have seen the Governor give the Board his views on the economy, rather than the reverse.

I believe a Board meeting in the Maritimes coincided with the signing of the ill-fated 1958 Conversion Loan, the largest financial operation in years. If the Commission ascertained from the Board's minutes whether the Board were told of this coming program, and if so, whether it tendered any advice, the Commission might determine what value the Governor placed upon the Board's advice. The same records should show the date of the meeting, and if the printing errors, etc. were coincident.

Further, Government might derive real aid and advice from a small group of people with practical backgrounds in finance and economics, even if we must think the geographical representation principle, plus the ban on bankers which may now put our most knowledgeable money-men

Board of Directors - continued

(23) Such advisers might aid a Governor on technical matters, restrain him from pursuing moral suasion too far beyond his legal powers, or from trespassing into fields of public policy reserved to Government or Parliament, yet buttress the Governor against unwise policies advocated by economically uninformed Ministers by showing that the Governor had the backing of the financial community. (F)

(24) Such a Board could also explain Bank Policy. There is suspicion in financial and business circles of government institutions directed exclusively by professional public servants lacking practical business, economic, financial or psychological experience. Spokesmen with acknowledged competence in the business and academic world could improve the Bank's image and public confidence in its policies.

(25) Members of the Federal Reserve Board in Washington, (14 year terms, \$20,000 salary) are not dominated by the Chairman (4 year term, extra stipend \$500), and these full-time Board members frequently expound Board policy, visiting the twelve districts to supplement the (usually twice a year) visits of the Chairman.

(26) As a visitor to many American banks and dealers, I can say that the usually frank critiques of the Administration or Treasury seldom are augmented by criticism of the "Fed" or its Board members. Possibly one explanation is the smaller debt management role of the "Fed", compared to Bank of Canada, plus the "Fed's" adherence to its legal powers with little reliance on moral suasion, compared to Bank of Canada. Yet, in London, where the Bank of England has both a large finger in debt management, and employs moral suasion extensively, but has many respected "City" people on its Court, criticism of the Bank in the "City" is rather small.

(27) Though shunning popularity contests, Central Banks merit the respect and confidence of the private financial sector, to which a proper Board would contribute. Such goodwill existed long after the War, even with the present type of Board, perhaps due to memories of wartime collaboration on War Finance, but more likely due to the personality, wide experience, and universal respect enjoyed by Mr. Towers, whose "feel and flair" may have concealed many structural flaws more evident under more mechanistic management in recent years. (F)

Board of Directors - continued

Such advisers might aid a Governor on technical matters, restrain him from pursuing moral suasion too far beyond his legal powers, or from thrusting into fields of public policy reserved to Government or Parliament, yet without the Governor against unwise policies advocated by economically untrained Ministers by showing that the Government had the backing of the financial community.

Such a Board could also expand Bank Policy. There is suspicion in financial and business circles of Government institutions directed exclusively by professional public servants lacking practical business, economic, financial or psychological experience. Spokesmen with acknowledged competence in the business and academic world could improve the Bank's image and public confidence in its policies.

Members of the Federal Reserve Board in Washington, (in your terms, \$20,000 salary) are not dominated by the Chairman (4 year term, extra stipend \$500), and these full-time Board members frequently expand Board policy, visiting the twelve districts to supplement the (usually twice a year) visits of the Chairman.

As a visitor to many American banks and dealers, I can say that the usually frank criticism of the Administration or Treasury seldom are augmented by criticism of the "Fed" or its Board members. Possibly one explanation is the smaller debt management role of the "Fed", compared to Bank of Canada, plus the "Fed's" adherence to its legal powers with little reliance on moral suasion, compared to Bank of Canada. Yet, in London, where the Bank of England has both a large finger in debt management, and employs moral suasion extensively, but has many respected "city" people on its Council, criticism of the Bank in the "City" is rather small.

Though shrinking popularity contests, Central Banks merit the respect and confidence of the private financial sector, to which a proper Board would contribute. Such goodwill existed long after the war, even with the present type of Board, perhaps due to memories of wartime collaboration on War Finance but more likely due to the personality, wide experience, and universal respect enjoyed by Mr. Towers, whose "feel and fair" may have concealed many structural flaws more evident under more mechanistic management in recent years.

THE GOVERNOR

(28) The past year's events indicate beyond question that Parliament should by legislation clarify the position of the Governor as to tenure, grounds for dismissal, and pension.

RESPONSIBILITY TO GOVERNMENT

(29) Obviously Government cannot long escape responsibility for Bank policy, but for varying periods Ministers have disowned unpopular policies, while seldom hesitating to take bows for popular Bank moves. I believe some Central Bank Acts specify that the Bank's policy must be that of the Government, for which Government is responsible, thus hindering Ministers who would play Pontius Pilate in Parliament.^(F) I hope the Commission will suggest such an amendment to the Bank of Canada Act.

GENERAL POWERS of BANK and/or GOVERNOR

(30) Many people, including a former Governor, believe that the Bank's powers over banks, finance companies, and other institutions should be enlarged. Whatever these changes may be, I think they should be covered by specific legislation, so Parliament and/or its committees can hear witnesses, discuss the matter, and enact the changes, making sure the powers are to be used openly.^(F)

(31) The Bank obtained "agreements" from chartered banks, not specifically blessed by the Act, notably those respecting secondary reserves and term loans, with no one certain whether the Bank's arguments, or the fear of the Bank's legal right to raise cash ratios, etc., tipped the scales. When the banks began augmenting secondary reserves by switching for bills, the bond market learned, after a costly period of secrecy, what was on foot through a bank "leak". Monetary policy was being made in secret.

(32) Other attempts to make changes without legal authority were less successful, notably suggestions anent notional segregation of savings deposits, and suggestions made to finance companies (though chartered bank credit lines for finance companies were frozen). Perhaps other sectors of the economy incurred official displeasure, with the Bank acting in the public interest -- as it saw it -- but without specific authority, to allocate resources (credit being the ration coupons) between different classes of borrower. Similarly limits on term lending may have penalized one company lacking other sources of funds, as against another with additional, perhaps non-Canadian, facilities.

General Powers of Bank and/or Governor - continued

(33) Though the Combines Act exempts Finance, such joint actions by Bank of Canada and satellite chartered banks are a de facto restraint of finance. If this be deemed in the public interest, surely legislation should spell out how, when and where, at least as to area, though I would not want to see rigid formulae in the Act. I hope the Commission can examine the place of term loans, notional segregation of savings, regulation of finance companies, etc., and reject or recommend appropriate legislation. I think the term loan has a valuable service to perform for a customer where the banker can accommodate him better than alternative finance.^(F) If at times it is an expansionary force to money supply it is no more so, and perhaps more productive than a government deficit or N.H.A. mortgage.

(34) The Inspector General has access to chartered bank books, the purpose being stated (in Section 63 of the Bank Act) as being primarily for the protection of creditors and shareholders of a bank. Notwithstanding Section 67, (respecting secrecy) the Minister, Deputy, Bank of Canada Governor or his representative, appointed in writing, has access to any information regarding the affairs of a bank.

(35) When Parliament creates a right of enquiry for one purpose - i.e. protection of depositors and shareholders, should not parliament make sure it is not used for other purposes, such as the allocation by Bank of Canada of credit as between different customers of banks, or different industries, or in any way to discriminate against any chartered bank or customer thereof. There should be some safeguard in this regard.

(36) Financial institutions, trustees of others' funds, conduct business with prime regard to their trust funds, and some regard for their shareholders. Where the "public interest" is not defined by Parliament, such institutions will naturally do as prudence dictates, loathe to heed interpretations of "public interest" defined solely by Bank of Canada, in areas where the Bank lacks legal power. Our American friends long ago preferred a government of laws to one of men, and the Federal Reserve does little without legal authority.

(37) The 1958 Conversion Loan involved considerable pressure on financial institutions, many of whom felt that Conversion of their Victory bonds was against their best interests. The Banks nominally were in the most vulnerable position.

General Powers of Bank and/or Governor - continued

(38) Though Mr. Fleming told the House (Hansard, August 29, 1958, page 4278), "The terms of the loan were clearly laid down at the beginning and there has been strict insistence on adherence to those terms", some banks may have exchanged some Victory bonds for more suitable (but not Conversion Loan) bonds, which originally emanated from Bank of Canada's own portfolio. Since all large investors were on an "exempt" list, with participating dealers barred from trading Victory or Conversion bonds with these names, except as designated by and for "The Committee", the "free bond market" was effectively closed to sizeable dealing during the Loan. Bank of Canada published a price list on Canada issues, including well marked-up prices for Victory issues. A "secondary marketing committee" of dealers was trading in the Bank, with Bank funds. The "market", to all intents, existed only in the Bank of Canada during the Loan, in such volume and at such level as the Bank and its "dealer committee" decreed. See Appendix III.

(39) I re-laundry this old linen to forestall the excuse that any large special deals must have been executed "through the market". The market was the Bank, or its agents. Only a detailed audit of the Bank and chartered banks' books would show the extent and truth of widespread rumors of special deals.

(40) The point of mentioning special deals, differing from the official Conversion, is that they represent another exercise of discriminatory, discretionary power, not within the ken of Parliament, and unknown to the average investor, offered only the official deal. Since current deficits and growing short term debt presage another Conversion in a year or so, I think the Bank's power to apply pressure, or to do special deals, should be sanctioned or prohibited by law, as Parliament shall decide.

(41) I would hope Parliament would prohibit these practices, but in any event the 1958 situation cast no credit on the ethical concepts of a public institution.

MONEY MARKET WITHOUT SPECIFIC LEGAL BASIS

(42) The Bank of Canada may make loans to banks, provinces and the Federal Government (but not dealers) under Section 18, Subsection 1, paragraphs h, i and j of the Bank of Canada Act. Paragraph k permits the

Through Mr. Fleming told the House (Hansard, August 29, 1958, page 4248), "The terms of the loan were clearly laid down at the beginning and there has been strict insistence on adherence to those terms," some banks may have exchanged some Victory bonds for more suitable (but not conversion loan) bonds, which originally emanated from Bank of Canada's own portfolios. Since all large investors were on an "exempt" list, with non-portfolios. These names, except as designated by and for "The Committee", the "bond market" was effectively closed to dealers dealing during the loan. Bank of Canada published a price list on Canada issues, including well marked-up prices for Victory issues. A "secondary marketing committee" of dealers was trading in the Bank with Bank funds. The "market", to all intents, existed only in the Bank of Canada during the loan, in such volume and at such level as the Bank and its "dealer committee" desired. See Appendix III.

I re-emphasize this old lesson to forestall the notion that any large was the Bank, or its agents. Only a detailed audit of the Bank and chartered banks' books would show the extent and truth of widespread rumors of special deals.

The point of mentioning special deals, differing from the official conversion, is that they represent another exercise of discretionary, discretionary power, not within the ken of Parliament, and unknown to the average investor, offered only the official deal. Since current deficits and growing short term debt pressure another conversion in a year or so, I think the Bank's power to apply otherwise, or to do special deals should be sanctioned or prohibited by law, as Parliament shall decide.

I would hope Parliament would prohibit these practices, but in a event the 1958 situation must be based on the official concept of a

1
2
3 Bank to buy and sell securities from or to any person, in categories which
4 may be summarized as Canadas, Provincials, U.S. and U.K. governments, and
5 certain commercial paper.

6 (43) I think that the "money market", i.e., the execution of purchase
7 and resale agreements with certain dealers, rests only on the authority of
8 paragraph k, with the Bank interpreting "any person" to mean only those
9 dealers whom it accepts and who abide by the criteria, and regulations,
10 which the Bank may from time to time lay down. In effect these dealers are
11 privileged, during "good behavior" as the Bank defines it.

12 (44) Paragraph k, though broad enough to permit the Bank to do re-
13 purchases with "any person", gives the Bank opportunities to use re-discount
14 privileges to secure dealer cooperation, or acquiescence in many areas,
15 including portfolio composition.

16 (45) It would, I think, be wise if Parliament formally put the "money
17 market" in the Bank of Canada Act, with a known and specified set of regu-
18 lations, so that "any person", or "any dealer" (if this is what the Act
19 means) should have access to the Bank on known terms, against specified
20 collateral with specified margin, and so no one enjoys discriminatory or
21 discretionary power.

22 (46) The banks know how and when they can borrow, from the Act. Should
23 not the "money market", with "common law" status, ~~not~~ be recognized, de jure,
24 as well?

25 (47) In the United States the Federal Reserve Banks can, at auction, run
26 off bills in portfolio, or replace them with the same amount, but if they
27 wish to acquire additional bills, they must buy in the open market after the
28 auction. Such a rule might be desirable here to make more Central Bank
29 net buying of bills take place in the open, and not through an unduly high
30 bid designed to influence the average price and yield.

ACCOUNTS AND GOVERNOR'S REPORT

31 (48) Parliament should by statute receive and discuss, in Committee or
32 full session, the Bank Governor's annual report, for the lack of such
33 examination for some years may have contributed to the events of 1961.

34 (49) Professor Gordon (CPSA Journal Reprint, February, 1961, page 13)
35 claims that the Bank's rights to publish what it pleases, and to spend its
36 independent income as it pleases, constitute weapons of great power.
37 Gordon's book (The Economists versus Bank of Canada, Ryerson, Toronto, 1961),

Bank to buy and sell securities from or to any person, in circumstances which may be summarized as General, Provincial, U.S. and U.M. Governmental, and certain commercial paper.

I think that the "money market", i.e., the execution of purchases and resale agreements with certain dealers, rests only on the authority of paragraph 1. with the Bank intervening "any person" to mean only those dealers whom it recognizes and who come to the market, and negotiation, which the Bank may from time to time refuse. In effect these dealers are privileged, during "good" periods, as the Bank defines it.

Paragraph 1. though broad enough to permit the Bank to do the purchases with "any person", gives the Bank opportunities to use its discretion to reserve dealer cooperation, or participation in any sense.

It would, I think, be wise to limit the Bank's role to the "money market", in the Bank's hands, with a known and specified set of conditions, so that "any person", or "any dealer" (it is in what the Bank means) should have access to the Bank on known terms, against specified collateral, with specified margins, and to no one enjoys discretion now or

The banks know how and when they can borrow from the Bank. Should not the "money market", with "common law" restrictions, be restricted, as well?

In the United States the Federal Reserve Bank has, at several times off bills in circulation, or reserves from the Treasury, and in view of the wish to acquire additional bills, they have been in the open market of bills to auction. Such a rule might be desirable here to make more certain Bank net buying of bills take place in the open, and not through an underhand bid designed to influence the average bid and yield.

ACCOUNTS AND GOVERNOR'S REPORT

Parliament should by statute require the Governor, in his report on the Bank's assets, the Bank Governor's annual report, for the Bank of England, examination for some years may have been required of the Governor's report. Professor Gordon (OBEA General Report, November 1931, para. 12) claims that the Bank's right to refuse to purchase, and to hold independent income as its pleasure, constitutes a source of general profit. Gordon's book (The Economists' view of the Bank of England, London, 1931).

Accounts and Governor's Report - continued

also suggests that the Bank could hire public relations men "to put an effective gloss on the public statements and speeches of its officials.... to create a favorable image of the Bank" (page 7). These remarks, seemingly facetious when written, assume more importance in the light of the press releases from the Bank this past summer.

Gordon further feels the Auditor General should be the Bank auditor, and remarks (CPSA Journal Reprint, February, 1961, page 22),

"If we assume however that the Bank of Canada as it is now constituted never makes deals of a questionable nature, we may be assuming too much. If the Bank of Canada were to engage in such a transaction, it would probably never see the light of day. But if....the Auditor General were designated as the Bank's auditor....any irregularities of this nature would find their way into the Auditor-General's report, and would thus be opened to the scrutiny of Parliament and the general public. The independence of the Bank of Canada from the Auditor General does not guarantee the integrity or impartiality of the Bank's practices nearly as much as it guarantees their secrecy....."

I would support Gordon's contention, citing the Conversion Loan.

BANK RATE

In most countries the Central Bank sets a Bank or re-discount rate of interest, at which it will, as lender of last resort, accommodate banks, or dealers on short government or even commercial paper. Bank Rate is the traditional U.K. signal of official opinion on interest rates.

It was so in Canada, until, in late 1956, the Bank set Bank Rate at 0.25% above the yield of the weekly auction of 91 day Treasury bills, a rate which the Bank could influence crudely by its own bids for bills, and through loosening or squeezing the chartered banks cash positions.

The original motive for "floating" the rate may have been to end the criticism which arose several times in 1956 when Bank Rate was raised. The "floating rate" took Bank Rate off "page one", returning it to an obscure corner of the financial page. The Bank (or government) were no longer responsible for rising rates; one could now blame U.S. rates, or "the market"!!

also suggests that the Bank could hire public relations men "to put an effective gloss on the public statements and speeches of its officials..... to create a favorable image of the Bank" (page 7). These statements, however, are written, assume more importance in the light of the press releases from the Bank this past summer.

Gordon further feels the Auditor General should be the Bank "if we assume however that the Bank of Canada as it is now constituted never makes deals of a questionable nature, we may be assuming too much. In the Bank of Canada were to engage in such a transaction, it would probably never see the light of day. But if.... the Auditor General were designated as the Bank's auditor.... any irregularities of this nature would find their way into the Auditor General's report, and would thus be opened to the scrutiny of Parliament and the general public. The independence of the Bank of Canada from the Auditor General does not guarantee the integrity or impartiality of the Bank's practices nearly as much as it guarantees their secrecy....." I would suggest Gordon's contention, adding the

Constitution loan.

In most countries the Central Bank sets a Bank or re-discount rate of interest, at which it will, as lender of last resort, accommodate banks, or dealers on short government or even commercial paper. Bank Paper is the traditional U.K. signal of official opinion on interest rates. It was so in Canada, until, in late 1956, the Bank and Bank Paper at 0.25% above the yield of the weekly auction of 91 day Treasury bills, a rate which the Bank could influence directly by its own bids for bills, and through loosening or tightening the discounted bank cash positions. The original motive for "floating" the rate may have been to end the criticism which arose several times in 1956 when the rate was raised. The "floating rate" took Bank Paper off "page one", returning it to an obscure corner of the financial page. The Bank (or government) were no longer responsible for raising rates; one could now blame U.S. rates, or

I think Bank rate. should be restored to symbolic status, by having it again arbitrarily set by the Bank. Other countries occasionally find dealers or banks borrowing at Bank Rate to carry bills bearing a higher rate. The Bank can raise its rate on a renewal loan, without changing Bank Rate, with the renewal rate being tantamount to a refusal.

I agree that a violently fluctuating Bank Rate, for example the floating rate, gives confusing week-to-week signals of Bank policy. In Canada we do not have the "open mouth policy", such as the "Fed" employs, to supplement the discount rate, for hardly a week passes in the U.S. without some public appearance by a Board member, giving the Board's views.

Variations in chartered bank cash, sometimes seasonal, sometimes from erroneous projections (quickly reversed the next week) sometimes from bad weather raising the volume of items in transit, also do not correctly indicate Bank policy. These errors are more unsettling when the chartered banks are kept on a tight rein by technicians who aim at a sort of push-button system where close linkage provides immediate bank reserve reaction to Central Bank action, for there is little cushion available.

CONFLICTS OF INTEREST

The Bank of Canada buys and sells securities to regulate the reserves of the chartered banks -- a monetary policy function. It may also use open market operations to aid debt management, acting as agent for the Finance Department. (F)

It is difficult to serve two masters, and the Bank of Canada's securities department faces conflicts of interest between what is best for monetary policy, and what is best for debt management. (F)

The Bank, as money managers might wish to tighten the banking system, while simultaneously the Bank as Finance's debt management agent wanted to finance at an advantageous rate. The bond market could be "rigged", by even easier money, until the new issue was floated off, after which the temporary money -- and even more to compensate for delay-- could be pulled out to tighten the system.

Bruce King MacLaury, one time economist for the Federal Reserve Bank of New York, in a Ph.D. Thesis for Harvard, (on Canada's money market) February, 1961, pages 71-2-3, states with delicacy:

Bank of New York, in a Phil. Inquirer for Newark, (on Canada's money market) Prince King Macleary, one time economist for the Federal Reserve

Conflicts of Interest - continued

"Unlike the Federal Open Market Committee, which explicitly adopted a hands off policy with respect to easing the reception of new Treasury issues or refundings, the Bank of Canada has consistently geared its operations in the market on such occasions to meet the needs of the situation....This process of "sweetening the market" appears in retrospect to have interfered with the Bank's "dynamic" responsibilities on this occasion although at the time the authorities were just beginning to pull in the credit reins on the expansion of bank loans and were probably not aware of the conflict of interests. On other occasions the conflict has been quite apparent to the authorities and as a result the "sweetening" process has been all too transitory from the point of view of the dealers who have not been able to dispose of their own inventories of the new issue before the market fell...."

Thus an outsider, sympathetic to Central Bank problems, remarks that the U.S. do not "rig" their markets for new issues, while Canada does, and he cites numerous examples. Ethics aside, the common knowledge of this "rigging and plug pulling", to use more earthy language, generates suspicion by both dealers and investors who were past victims of misleadingly attractive (for the fleeting moment) new issues. Solving the conflict of interest this way thus has its own costs -- loss of confidence, and diminished credibility for the Bank and its pre-issue "now-you-see-it-now-you-don't" easy periods. (F)

Originally the Bank may not have sought too much responsibility for debt management, but this grew, perhaps inadvertently, when larger refundings plus the post-1957 deficits found the Finance Department lacking a well-staffed Debt Management Division, with its own economists, etc. Thus the Department may have leaned increasingly on the Bank for advice. This advice may have at times reflected more concern for monetary policy than for debt management, though the flavor may have been imperceptible to the Bank officials giving it. Eventually the camel may have enjoyed getting further into the tent.

Sometimes the Bank may have been more conscious of its monetary aims when it gave government debt management advice, without full explanation. The 1958 Conversion was extolled as a "clean up" for

"Unlike the Federal Open Market Committee, which explicitly adopted a hands off policy with respect to issuing the reception of new Treasury issues or refinancing, the Bank of Canada has consistently geared its operations in the market on such occasions to meet the needs of the situation... Thus an outsider, sympathetic to Central Bank problems, remarks that the U.S. do not "rig" their markets for new issues, while Canada does, and he offers numerous examples. Ethics aside, the common knowledge of this "rigging and ring pulling", to use more earthy language, generates suspicion by both dealers and investors who were past victims of misleadingly attractive (for the fleeing moment) new issues. Solving the conflict of interest this way thus has its own costs -- loss of confidence, and diminished credibility for the bank and its pre-issue "now-you-see-it-now-you-don't" easy periods. (7)

Originally the bank may not have sought too much responsibility for debt management, but this grew, perhaps inadvertently, when larger rolundings plus the post-1957 deficits found the Finance Department lacking a well-staffed Debt Management Division, with its own economists, etc. Thus the Department may have leaned increasingly on the bank for advice. This advice may have at times reflected more concern for monetary policy than for debt management, though the latter may have been impermeable to the bank officials giving it. Eventually the central bank may have enjoyed getting further into the debt.

Sometimes the Bank may have been more concerned of its monetary aims when it gave government debt management advice, without full explanation. The 1956 Conversion was explained as a "clean up" for

Conflicts of Interest - continued

"short term debt" (including some bonds not due until 1962-3-6), with the Minister even being induced to claim that the market viewed such bonds as due on their 1959-61-63 call dates, though they were selling well below par !!! Since the Minister was relatively new, maybe he was only repeating what he was told and believed he was selling a scheme of debt re-arrangement, even saying of the Loan (which raised interest rates immediately) (Hansard, July 14, 1958 - page 2203):

"....the beneficial results of this will extend well beyond the market for Canada bonds and into the market for provincial, municipal and corporate bonds."

I regard this loan as primarily monetary policy, designed to strip the public of short Victory bonds, due 1959-60, because these, plus enlarged money supply, and more short issues for deficit finance, would create an overly liquid public, at a time when the economy turned to recovery, or even boom. That reduced liquidity, or a "tight money policy", was near, probably never struck the Ministers who, in apparent good faith were promoting a deal which "tight money" would turn into a trap.

This is not a view from hindsight, for I would quote from a letter dated July 16, 1958, sent to the Governor by my partner and self.

"We have been examining the considerations which we think would properly reflect the thinking of a Central Bank at this juncture. We think we would, as Central Bankers, come to the following conclusions:-

1. Large scale deficit financing for 1958-61 involves substantial monetary expansion.
2. Eventually this will create renewed inflationary pressures of major proportions.
3. The dampening of this inflation will require a cruelly tight money policy - (very low bond prices).
4. Such a policy cannot be too successful if there is excess public liquidity. (In other words, the public should not be allowed to own too many short term bonds which can be turned into cash by their early maturity, or by sale at a small loss).
5. It would seem necessary at this juncture to take steps to deprive the public of much of their liquidity. (In other words, the public must be induced to replace their short

"short term debt" (including some bonds not due until 1952-3-6), with the Minister even being induced to claim that the market viewed such bonds as due on their 1952-61-63 call dates, though they were selling well below par !!! Since the Minister was relatively new, maybe he was only repeating what he was told and believed he was selling a scheme of debt re-arrangement, even saying of the loan (which raised interest rates immediately) (Hansard, July 14, 1958 - page 2503):

"...the beneficial results of this will extend well beyond the market for Canada bonds and into the market for provincial, municipal and corporate bonds."

I regard this loan as primarily monetary policy, designed to strip the public of short victory bonds, due 1952-60, because these, plus enlarged money supply, and more short issues for deficit finance, would create an overly liquid public, at a time when the economy turned to recovery, or promoting a deal which "tight money" would turn into a trap.

There is not a view from hindsight, for I would choose from a letter dated July 16, 1958, sent to the Governor by my partner and self, we have been examining the situation since that time. Properly reflect the thinking of a Central Bank at this juncture. We think we would, as Central Bankers, come to the following

1. Large scale deficit financing for 1959-61 involves substantial monetary expansion.
2. Eventually this will create renewed inflationary pressure of major proportions.
3. The dampening of this inflation will require a curiously tight money policy - (very low bond prices).
4. Such a policy cannot be too successful if there is excess public liquidity. (In other words, the public should not be allowed to own too many short term bonds which can be turned into cash by their early maturity, or by sale at a small loss).
5. It would seem necessary at this juncture to take steps to deprive the public of much of their liquidity. (In other words, the public must be induced to replace their short

terms with long dated issues, which could, under tight money, be liquidated only at a substantial loss).

6. Since this situation exists in the United States also, there is all the more reason for meeting the problem here first.

Since however, we are not Central Bankers, but Bond Dealers, the same reasoning dictates that we, recognizing our primary responsibility to the clients we advise, examine how best these clients can be served. We also see:

1. Absolutely no evidence of any cutback in Federal spending.
2. Monetary expansion in the order of roughly \$ 1 1/4 billion since August, 1957 (with the new \$400 million issue).
3. Enough deficit financing in the next year or three to cause considerably more monetary expansion, or much higher interest rates in the long end of the market, or both, and when the inflationary pressures become severe, there may be a need for a severe money squeeze -- with very depressed bond prices.

These considerations should therefore cause us to counsel clients to preserve liquidity at all costs.

If we believe that the preservation of maximum liquidity would be in the best interests of the clients we advise, our participation in an enterprise involving switches to long bonds (which would reduce liquidity) cannot be wholehearted. In fact this participation might be mis-construed by those we normally advise, as a tacit endorsement of all such exchanges, and we would not wish this to happen.

We therefore think that the only honest thing we can do is to withdraw from the organization for the 1958 Conversion Loan forthwith, with the least embarrassment to all concerned....."

(67)

In discussing this letter with the Governor, no attempt was made to disabuse us of our ideas which proved well founded within two months. We claim no monopoly for this view, in July, 1958, or now. We also viewed the marking up of Victory bonds prices, in one case by five points as unethical market rigging. (F)

be considered only as a substantial issue).

Since this situation exists in the United States also, there is all the more reason for meeting the problem here first.

Since however, we are not Central Bankers, but Bond Dealers, the same reasoning dictates that we, recognizing our primary responsibility to the clients we advise, examine how best these clients can be served.

We also see:

1. Absolutely no evidence of any outbreak in Federal spending.
2. Monetary expansion in the order of roughly \$ 1 1/4 billion since August, 1957 (with the new \$400 million issue).

Enough deficit financing in the next year or three to cause considerably more monetary expansion, or much higher interest rates in the long end of the market, or both, and when the inflationary pressures become severe, there may be a need for a severe money squeeze -- with very depressed bond prices.

These considerations should therefore cause us to counsel clients to preserve liquidity as all costs.

It is believed that the preservation of maximum liquidity would be in the best interests of the clients we advise, our participation in an enterprise involving switches to long bonds (which would

reduce liquidity) cannot be wholehearted. In fact this participation might be misinterpreted by those we normally advise, as a tacit endorsement of all such exchanges, and we would not wish this to happen.

We therefore think that the only honest thing we can do is to withdraw from the organization for the 1958 Convention loan forthwith, with the least embarrassment to all concerned....."

In discussing this letter with the Governor, no attempt was made to dissuade us of our ideas which proved well founded within two months. We claim no monopoly for this view, in July, 1958, or now. We also viewed the marking up of victory bonds prices, in one case by five points as unethical market rigging. (P)

Conflicts of Interest - continued

(68) An expert debt management division in Finance would have recognized the Loan for what it was; it might have been vetoed, or if authorized in modified form, Ministers would have been less enthusiastic in selling a monetary trap, or countenancing (if indeed they were aware of) the high pressure methods of the Bank and some dealers. I think the after effects, the huge dis-investment, reflected the fears of "tight money to come", plus real institutional resentment of the high pressure tactics. With more debt management responsibility in Finance, I think recognition of the conflict of interest would have ensued, and the country spared some of the disorderly markets of 1959.

(69) The Investment Committee of Unemployment Insurance Funds, which included Bank and Finance officials, acquired in July, 1958, long Conversion bonds, giving up its more liquid 1959-60 Victories, but a few months before predictable seasonal needs compelled liquidation of the long issues at substantial loss. An independent trustee, uninterested in debt management schemes, might have stressed liquidity. This conflict has now been solved by Ottawa giving UIF demand instruments, but there is no guarantee that Trust Funds may not again be used for debt management ends. Bank officials on these boards must compromise the conflicts of monetary policy, debt management and trusteeship (See Appendix III)

(70) Conflicts of interest are better settled at arms length between opponents of equal power and information, than by one agency serving two or three masters. I would hope the Bank will cease to be represented on Trust Fund boards.

(71) I feel that the Bank's activities in the bond market have contributed to its disorganization, because the bank chose to make monetary adjustments, which could have been effected in the bill or short area, in the longer area for purposes of debt management, to "produce a yield curve", or to "nudge" prices, all symptoms of conflict of interest, and bad compromise.

(72) Recently the Bank's incursions into the long area have been mainly as buyer, acting for the Purchase Fund. Yet as recently as January, 1962, the bank acquired a new issue of bonds due 1968, and attempted re-sale at a time when the banks were receiving a flow of post-Christmas cash from the public, something the Bank normally mops-up, lest it inflate bank reserves. It sold few bonds in what appears to have been a compromise between the

monetary objective described, and the debt management objective of selling medium term issues. It has had to sell bills and shorts for the "top-up", even doing a re-purchase (selling some shorts to government which temporarily reduced government deposits), while it has again created market apprehension. Though of conflicts of interest, and compromises!

THE FINANCE DEPARTMENT

THE MINISTER

(73) The Canadian Minister is overworked by comparison with the Secretary of the Treasury, a Presidential appointee, whose time in Congress is but a few committee hearings. The Minister must spend much time in the Commons. The Treasury Secretary does not prepare the budget (The Minister, in Canada, does); for the U.S. has a Budget Bureau, and there is another U.S. official, the Treasurer of the U.S. who may correspond to our Minister's other title of Receiver General. Maybe we should split the Finance Minister's job.

(74) I believe the U.S. Secretary can and does devote considerable time to debt management, on a scale physically impossible for a Canadian Finance Minister.

THE DEPUTY MINISTER

(75) Backstopping the Minister with material for use in the House, plus budget matters, are two jobs our Deputy has, which lack U.S. counterparts. There are two U.S. Undersecretaries anyway, one of whom is usually experienced in banking or finance. The current incumbent was, until a year ago, a senior official of the Federal Reserve Bank of New York, and devotes perhaps a majority of his time to debt problems.

DEBT MANAGEMENT DIVISION

(76) The U.S. Treasury Debt Management Division, adviser to the Secretary, contains perhaps twenty-five officials, including economists, researchers, and an actuary, who consult with bankers and government dealers, leaning little on the "Fed" until they conceive their own ideas. These may then be discussed with the "Fed" at a high level, so that compromises between debt and monetary policies can be thrashed out between equally powerful and well informed partisans. (F)

(77) We have many capable people in Canada's Finance Department, but carrying so many responsibilities, we do not seem to have a debt management division in depth, with research staff to match that of the Bank. Consequently much depends on advice screened through the Bank, and perhaps unconsciously flavored with monetary policy interests.

(78) Selling bonds is a unique function where Ottawa is selling merchandise, instead of taking taxes from pay cheques, or giving handouts to grateful citizens. Neither the overworked officials in Finance, nor the Central Bankers with experience in nudging a captive banking system have any background in merchandising, calculating public psychology, or demand,

THE U.S. TREASURY DEBT MANAGEMENT DIVISION

The U.S. Treasury Debt Management Division, adviser to the Secretary, contains perhaps twenty-five officials, including economists, researchers, and an actuary, who consult with bankers and government dealers, learning little on the "red" until they conceive their own ideas. These may then be discussed with the "Fed" at a high level, so that compromise between debt and monetary policies can be thrashed out between equally powerful and well informed parties. (P)

We have many capable people in Canada's Finance Department, but carrying so many responsibilities, we do not seem to have a debt management division in depth, with research staffs to match that of the Bank. Consequently much depends on advice received through the "Fed" and received unconsciously filtered with monetary policy intentions.

Selling bonds is a unique function where there is no selling market. Instead of taking taxes from pay checks, or giving handouts to grateful citizens. Neither the overworked officials in Finance, nor the Central Bankers with experience in managing a captive banking system have any background in merchandising, calculating public psychology, or demands.

Debt Management Division - continued

and few have any background in the investment business.

(79) With a public relations campaign you can sell any merchandise -- good or bad -- perhaps once; but the bad eventually ruins the manufacturers reputation. The Conversion was a well publicized sale of unsuitable merchandise, witness the "refunds", and the bad taste yet extant. There is, I believe, more resentment about 4 1/2, 1983 selling at 93, because they were bought under pressure and exhortation, than about 3 1/4, 1979, at a 19 point loss, bought voluntarily. (F)

(80) If the Conversion damaged the reputation of Canada bonds to the point that subsequent issues have cost 0.25% extra yield, the cost per billion of subsequent financing is \$2,500,000 per annum for the life of the bonds. New issues, including Savings bonds, but not bills, in 1959-60-61 total about \$8.8 billions. I believe that the "tap loans" of the past year have also affected public confidence.

(81) I am not unmindful of the difficulties caused by the post-1957 series of deficits, but I reiterate that in these circumstances defects in debt management concept, technique, etc., are just that much more apparent and costly.

(82) I think we need a Debt Management Division in the Finance Department, with its own economists, research and perhaps marketing experts, capable of stressing debt management, not to be confused with the monetary objectives of the Bank. I realize that the best marketing experts probably earn as much or more than the Deputy, so we might need to create a Public Debt Commission, answerable to the Minister, but outside of the civil service pay scales (like the Bank or CNR presidency). The Chairman might be found in a Bank, and the marketing expert in one of the larger investment dealing firms.

(83) If the difference between the best and second-best debt management can shave interest costs by 0.125% per annum, (while perhaps aiding monetary policy too), we are discussing savings of \$22 millions per year on the present debt alone, to be realized as it is refunded - or \$1,250,000 per billion per annum on new issues.

(84) With current deficits we must give the public what it wants in the way of securities, rather than what Ottawa thinks it should buy and keep.

and few have any background in the investment business.

With a public relations campaign you can sell any merchandise -- good

or bad -- perhaps once; but the bad eventually ruins the merchandise reputation. The Corporation was a well publicized sale of marketable mortgage

debt, witness the "retunda", and the bad lease yet extant. There is, I believe, more resentment about it (1983 selling at 93, because they were bought under pressure and speculation, then about 3 1/4, 1979, at a 99 point

If the Corporation damaged the reputation of Canada bonds to the point that subsequent issues have cost 0.5% more yield, the cost per billion of subsequent financing is \$2,500,000 per annum for the life of the bonds. New issues, including savings bonds, but not bill, in 1983-84 total about \$8.8 billion. I believe that the "bad loans" of the past year have also

I am not unkind of the difficulties caused by the post-1977 series of deficits, but I reiterate that in these circumstances deficits are not management concept, technology, etc., are just that much more apparent and costly.

I think we need a Debt Management Division in the Finance Department, with its own economists, research and policy marketing experts, capable of stressing debt management, not to be confused with the monetary operations of the Bank. I realize that the best marketing experts probably come as much or more than the Deputy, so we might need to create a Public Debt Commission, answerable to the Minister, but outside of the civil service pay scales (like the Bank or CMB Presidency). The Chairman might be found in the Bank, and the marketing expert in one of the larger investment dealing firms.

If the difference between the best and second-best debt management can shave interest costs by 0.125% per annum (which perhaps saving money policy too), we are discussing savings of \$2 million per year on the present debt alone, to be realized as it is refinanced - or \$1,500,000 per billion per annum on new issues.

With current deficits we must give the public what it wants in the way of securities, rather than what Ottawa thinks it should pay and have.

Debt Management Division' - continued

This is a job for a marketing psychologist rather than an expert with a slide rule, or statistics which indicate that savings depositors should buy this, or banks "ought" to buy that. (F)

THE BUDGET

(85) While budgets may have once been a matter of adding up revenue and expense, stating the difference as surplus or deficit, we have now the concept that "X" or "Y" deficit or surplus was "appropriate" to the state of the economy on a contra-cyclical budget basis. The basic determinants were supposed to be the economic slack or otherwise, and the GNP expected.

(86) We know that such budgets can produce errors of the order of \$200 millions through a small shift in GNP, so they are considered "hopes", and not rigid forecasts.

(87) Surely with this type of budget, it ought to be possible for the Speech from the Throne to give a "target" deficit or surplus, leaving the details for the regular budget.

(88) Are we not harming ourselves by carrying the British tradition of budget secrecy to ridiculous extremes in hiding what are really hopeful guesses -- the aggregate deficit -- until the full budget comes down? Even though the President does not know if Congress will pass the taxes involved, the U.S. manages to announce a budget target early every January. I advocate no premature revelation of tax or tariff changes, since our system of government gives 99% assurance that they will become law.

(89) Would we not be better with a rough gross deficit estimate, (speculating for a few months about taxes, etc.), than waiting for months to see when, or if, there will be a budget prior to election this year, or waiting until June in two recent years?

(90) It should not surprise you to hear that many would-be investors feel safer on the sidelines until the deficit is at least indicated. Since 1957 this uncertain mood is often reflected in pre-budget markets. (F)

This is a job for a marketing geologist rather than an expert with a slide rule, or statistics which indicate that savings reductions should buy this, or banks "ought" to buy that.

While budgets may have once been a matter of adding up revenues and expenses, stating the difference as surplus or deficit, we have now the concept that "X" or "Y" deficit or surplus was "appropriate" to the state of the economy on a contra-cyclical budget basis. The basic determinants were supposed to be the economic slack or otherwise, and the GNP expansion. We know that such budgets can produce errors of the order of \$500 millions through a small shift in GNP, so they are considered "hopeful" and not rigid forecasts.

Surely with this type of budget, it ought to be possible for the House from the House to give a "target" deficit or surplus, leaving the details for the regular budget.

Are we not harming ourselves by carrying the Indian tradition of budget secrecy to ridiculous extremes in hiding what are really political guesses -- the aggregate deficit -- until the full budget comes down? Even though the President does not know if Congress will pass the taxes involved, the U.S. manages to announce a budget target early every January. I advocate no premature revelation of tax or tariff changes, since our system would be better with a rough guess deficit estimate, (speculating for a few months about taxes, etc.), then waiting for months to see what, if, there will be a budget prior to election this year, or waiting until June in two recent years?

It should not surprise you to hear that many would-be investors feel safer on the sidelines until the deficit is at least limited. Since 1947 this uncertain mood is often reflected in pre-budget markets. (P)

THE BOND MARKET

(91) The term "bond market" is a generality, for there are many markets, ranging from the government market to the market in speculative, defaulted corporate issues.

(92) There are two broad government market sectors. The short term market consists of Treasury Bills, and bonds up to three years in term. There is a good volume of trade, and new trading opportunities arise from price changes of as little as 0.01% to 0.05%. The long term market is narrow, with low volume, with even price changes of 0.25%, or 0.50% often generating little additional trade. It was not always thus in the long market, but the deterioration commenced some years back.

(93) In Canada and the U.S., most trade occurs in the short term area, the securities being interest-bearing cash substitutes, dealt in by banks and corporations with money to lend at short term. In this area Central Banks can vary commercial bank reserves by purchases or sales which have minimum impact on capital values, both mathematically and because of the broad market. (A 0.01% change in Treasury Bill yields means but \$25 cash change in capital value per million, and a similar yield change on a 10 year 4% bond means a capital value change of \$800). In the U.S., a New York Times article of January 21 suggests that 75% of the trade in U.S. Governments occurs in the under one year area. (F)

(94) The importance of the short market in Canada and the U.S. has grown in recent years, for the debt has become more concentrated in this area, and fluctuating prices have shown many long term buyers of the 1940-50 era that practical liquidity is not provided by the ability to sell a long term bond at a 10 point loss. Both nations have found it increasingly difficult to sell long issues, and in varying degree have reluctantly produced the desired short term issues.

(95) Participants in the Canadian short market include Bank of Canada, chartered banks, trust companies and other financial institutions, industrial concerns and junior governments, etc., plus two groups of dealers -- those who enjoy re-discount privileges at Bank of Canada (and hence cheap day-to-day loans from the chartered banks) and those who do not. The chartered bank loan facilities are augmented by what are called "country banks", industrial corporations, junior governments, etc., who will lend for a day, a week or a

THE BOND MARKET

The long term market is narrow, with low volume, with even price changes of 0.25% or 0.50% often generating little additional trade. It was not always thus in the long market, but the deterioration commenced some years back.

In Canada and the U.S., most trade occurs in the short term area, the securities being interest-bearing cash substitutes, dealt in by banks and corporations with money to lend at short term. In this area Central Banks can vary commercial bank reserves by purchases or sales which have minimum impact on capital values, both mathematically and because of the fixed market. (A 0.01% change in Treasury Bill yields means but \$25 cash change in capital value per million, and a similar yield change on a 10 year 4% bond means a capital value change of \$300). In the U.S., a New York Times article of January 21 suggests that 75% of the trade in U.S. Government securities occurs in the under one year area.

The importance of the short market in Canada and the U.S. has grown in recent years, for the debt has become more concentrated in this area, and fluctuating prices have shown many long term buyers of the 1950-55 era that practical liquidity is not provided by the ability to sell a long term bond at a 10 point loss. Both nations have found it increasingly difficult to sell long issues, and in varying degree have reluctantly produced the desired short term issues.

Participants in the Canadian short market include Bank of Canada, chartered banks, trust companies and other financial institutions, and others -- these concern and junior governments, etc., plus two groups of dealers -- those who enjoy re-discount privileges at Bank of Canada (and hence cheap deposits) and those from the chartered banks (and those who do not). The chartered bank loan facilities are augmented by what are called "country banks", insurance corporations, junior governments, etc., who will lend for a day, a week or

The Bond Market - continued

month, at low rates of interest against suitable collateral. The securities eligible for re-discount at Bank of Canada (and hence for day-to-day loans from the banks) are Treasury Bills and Canadas under three years in term. In the aggregate the borrowings from the official money market are often less than those from "country banks" against similar collateral, while the "country bank" market is even larger when loans against other collateral, such as longer Canadas, provincials or finance paper are added.

(96) My firm was originally one member of the twelve dealers enjoying access to Bank of Canada funds. We withdrew from this group in about a year, for our line of credit was too small to finance an adequate inventory of more than one or two issues, for we do what is essentially a wholesale business. I understand that the lines of credit were given on the basis of total capital, and while our capital is and was small in relation to some of the larger firms doing a "financial department store" business, our capital is 100% available for the financing of government issues. Many larger firms have much capital tied up in sizable margin requirements for inventories or transit items in other types of securities. We feel that, without risk to our capital or customers, we have ample capital to carry six to ten times as large a position in short Canadas as the Bank allotted.

(97) We feel that the criterion should be that of our own bankers, i.e., the provision of adequate margin, currently not a prime factor in the Bank of Canada's repurchase activities.

(98) We have not regretted leaving the official money market, finding adequate accommodation from outside funds, (though at higher than day-to-day rates), for we can operate an adequate inventory, and are no longer subject to "suggestions" from Bank of Canada as to what issue or issues we should inventory. I suspect that profits have exceeded those we might have realized as continuing members of the money market, one reason being the freedom to expand or contract operations without hindrance or undue fear of official displeasure.

(99) I mention this because I think some official money market members have made excellent money in the short market, though the unofficial market may be more profitable to them than their relationship with the Bank. Others in the "club" may have done less well, and may at times indulge in activity because it is expected of them as continuing members of the official group. This may

month, at low rates of interest against suitable collateral. The securities eligible for re-discount at Bank of Canada (and hence for day-to-day loans from the bank) are Treasury Bills and Canadian under three years in term. In the aggregate the borrowings from the official money market are often less than those from "country banks" against similar collateral, while the "country bank" market is even larger when loans against other collateral, such as foreign Canadian, provincials or finance paper are added.

My firm was originally one member of the twelve banks enjoying access to Bank of Canada funds. We withdrew from this group in about a year, for our line of credit was too small to warrant an adequate inventory of more than one or two issues, for we do want as essentially a wholesale business. I understand that the lines of credit were given on the basis of total capital, and while our capital is and was small in relation to some of the larger firms doing a "financial department store" business, our capital is 100% available for the financing of government issues. Many larger firms have much capital tied up in sizable margin requirements for inventories or transit items in other types of securities. We feel that, without risk to our capital or customers, we have ample capital to carry six to ten times as large a position in short Canadian as the Bank allotted.

We feel that the criterion should be that of our own business, i.e., the provision of adequate margin, currently not a prime factor in the Bank of Canada's repurchase activities.

We have not regretted leaving the official money market, finding adequate accommodation from outside funds, (though at higher than day-to-day rates), for we can operate an adequate inventory, and are no longer subject to "suggestions" from Bank of Canada as to what issue or issues we should inventory. I suspect that profits have exceeded those we might have realized as continuing members of the money market, one reason being the freedom to expand or contract operations without hindrance or under the eye of official disapproval.

I mention this because I think some official money market members may have excellent money in the short market, though the unofficial market may be more profitable to them than their relationship with the Bank. Others, on the other hand, may have done less well, and may be dissatisfied in relation to the "club" it is expected of them as continuing members of the official group. This is

The Bond Market - continued

or may not benefit the market, over the long run, for such "shovelling smoke" may create difficulty for others.

I would like to see the "money market" at the Bank thrown open to all government bond dealers, (with adequate margin the sole basis for lines of credit), as and when it suited such dealer to participate. I think that the net result would be the concentration of the continuing business in the hands of three or four dealers, most of the time, with the others constituting an expansion and contraction of the total market as conditions warrant, and as the spirit moves them voluntarily.

The restricted "club" idea probably suits the Bank of Canada quite well, giving them an element of control over the members, keeping some of them in the market even when good judgment might suggest inactivity, and enabling the Bank to influence inventory details. Legally, as explained earlier, the official money market has no specified place in the Bank of Canada Act. This enabled the Bank to discriminate as between dealers, as regards lines of credit, using capital as a criterion, and to make such rules and regulations as it can enforce without driving dealers out of the market (even the allotments of new issues as between firms on new Canada issues can influence dealer thinking as regards Bank of Canada's wishes in the money market). The "club" idea gives the Bank some assurance of a number of "captive" bidders on bill issues, even if on only a token basis, something which might be lost if the market were open to all as they chose to come and go.

Over all this short term government market has considerable breadth and depth, and with the growth of the "country banks", plus the proliferation of bank deposit certificates, finance paper and commercial paper, short term funds can work advantageously in a variety of instruments with little risk. I think the "official money market is, like the iceberg above the surface, probably a small part of the total, but being visible to all, is the indicator for other sectors.

The long term market today seems incapable of absorbing any large volume of new Ottawa financing anywhere near the quotations, which in recent months have often been at such level as the Bank would pay for bonds as agent for the Government Purchase Fund. The long U.S. market suffers a similar disability, but is, I believe, at levels which reflect a lower content of official support. The Canadian market serves a useful purpose

The Bond Market - continuing

or may not benefit the market, even the long run. For such "showing" may create difficulty for others.

I would like to see the "money market" at the Bank thrown open

lines of credit, as and when it suited such dealer to participate. I think that the net result would be the concentration of the continuing business in the hands of three or four dealers, most of the time, with the others constituting an expansion and contraction of the total market as conditions warrant, and as the spirit moves them voluntarily.

The restricted "club" idea probably suits the Bank of Canada quite well, giving them an element of control over the members, keeping some of them in the market even when good judgment might suggest inactivity, and enabling the Bank to influence inventory details. Legally, as explained earlier, the official money market has no specified place in the Bank of Canada Act. This enabled the Bank to discriminate as between dealers, as regards lines of credit, using capital as a criterion, and to make such rules and regulations as it can enforce without driving dealers out of the market (even the allotments of new issues as between firms on new Canada issues can influence dealer thinking as regards Bank of Canada's wishes in the money market). The "club" idea gives the Bank some assurance of a number of "capable" bidders on all issues, even if on only a token basis. something which might be lost if the market were open to all as they chose to come and go.

Over all this short term government market has considerable breadth and depth, and with the growth of the "country banks", plus the proliferation of bank deposit certificates, Finance paper and commercial paper, short term funds can work advantageously in a variety of investments with little risk. I think the "official money market" is, like the Treasury above the surface, probably a small part of the total, but being visible to all, is the indicator for other sectors.

The long term market today seems incapable of absorbing any large volume of new Ottawa financing, anywhere near the proportions, which in recent months have often been at such level as the Bank would pay for bonds as agent for the Government Purchase Fund. The long U.S. market suffers a similar disability, but as I believe, at levels which reflect a lower content of official support. The Canadian market suffers a similar purpose

The Bond Market - continued

at artificial levels serving as a yardstick for other borrowers, such as Ontario, Quebec, etc., whose long term securities are absorbed without too much trouble. (F)

(104) The January 21st article in the New York Times bore the heading "U.S. 'Bond Market' held a Misnomer", and blamed the thinness of the long market primarily on "Government intervention into the investment field.... tending to make long term Government Bonds more and more meaningless to investors....". The article cited the competition created for long Treasury issues by those of U.S. Government agencies, and particularly by Government guaranteed FHA mortgages. Canada's NHA mortgage, affording 6.50% to institutions, is far more attractive than long Canada bonds at just over 5%. The mortgage lacks liquidity, but so, in practice does the long government bond when a sale would produce a "book loss" which must be charged to current income.

(105) The Times also cites official interference in the long term market as further reason why it has deteriorated particularly since the Federal Reserve departed from its "Bills usually" policy in February, 1961, and tried to depress long term yields, by buying longer government issues.

".... a question hangs over the long term market...When can dealers and private investing institutions again appraise the desirability of buying or selling Treasury bonds on the basis of their own views as to the likely course of the economy and of interest rates? The government bond men insist that so long as this question is left unanswered by the public authorities the long term Government bond market is destined to become thinner and thinner. What private dealer or investor would take a chance on reading the minds of political officials or pitting private financial resources against the immense financial power of the Central Bank? Repeatedly, during the year, the dealers have sensed in the central bank's buying orders an effort to bring about a maximum of price change in certain areas of the market by the use of a minimum amount of Federal Reserve Credit. This would be a reversal of traditional open market operations of the bank -- to effectuate a maximum amount of change in the reserve positions of the nations' banks with a minimum of effect on the market standing of Treasury

The Bond Market - continued

at artificial levels serving as a variation for other purposes, such as
Columbia, Quebec, etc., these long term securities are absorbed without too
much trouble.

The January 21st article in the New York Times bore the heading
"U.S. 'Bond Market' Held a Mystery", and blamed the thinness of the long
market primarily on "Government intervention into the investment field...
sought to make long term Government bonds more and more meaningless to
investors". The article then goes on to state that the Government
has been by close of U.S. Government agencies, and particularly of Government
guaranteed FHA mortgages, Canada's WNA mortgage, affording 6.5% to
institutions, in far more attractive than long Canada bonds at just over 5%.
The mortgage from liquidity, but no, in practice does the long Government
bond when a sale would produce a "book loss" which must be charged to

The Times also cites official intervention in the long term
market as further reason why it has deteriorated particularly since the
Federal Reserve departed from the "Bills usually" policy in February, 1961,
and tried to depress long term yields, by buying longer government issues.

"... a question hangs over the long term market... What can
dealers and private investors investing institutions again regarding the
desirability of buying or selling Treasury bonds in the face
of their own view as to the likely course of the economy and
of interest rates? The Government bond man insists that no long

the long term Government bond market is destined to become
thinner and thinner. What private dealer or investor would
take a chance on needing the funds of political officials or
putting private financial resources against the market?

Financial power of the Central Bank... Recently, during the
year, the dealers have earned in the central bank's buying
orders an effort to bring about a maximum of price change in
certain areas of the market by the use of a minimum amount of
Federal Reserve Credit. This could be a reversal of traditional
open market operations of the bank -- to allocate a maximum
amount of change in the reserve positions of the national bank

Securities.....The growing indifference of the investment community to long term government bonds, coupled with the mystifying bent of the public authorities to tinker with market rates are causing bond men to ask what purpose is being served by offering long term bonds for public subscription....." (New York Times, January 21, 1962)^(F).

For nearly a decade after abandoning the "pegged" bond markets which made the "Fed" an involuntary engine of inflation, the Board dealt mainly in Treasury Bills, or other very short instruments, in adjusting commercial bank reserves. Its very rare departures from this policy were usually to correct disorderly markets. This policy is well described in two pamphlets attached. One is by Winfield Riefler, the former executive assistant to the Board Chairman, reprinted from the Federal Reserve Bulletin of November, 1958. The other is by Mr. Riefler's successor, Ralph Young, and Charles A. Yager, reprinted from the Harvard Quarterly Journal of Economics for August, 1960.

The policy of "bills usually" rests on two basis:

1. Open market operations should be carried out in the broadest sector of the market, where they will have the least effect on capital values. Arbitrage will diffuse the effect throughout the longer market. The purpose of the operations is to regulate the cash reserves of the banking system -- not to mastermind all interest rates.
2. When operations are carried out in longer, thinner areas, such as long term bonds, they will repel some customers from the market, while attracting a speculative following. In the end the authorities may end with a level of rates largely of their own making, rates which have no particular relationship to where the government could borrow, and rates which may change when the support of the "Fed" and its speculative following is withdrawn. Such operations may permanently damage the long market by permanently repelling some erstwhile participants.

Early in 1961, at the behest of the President, the "Fed" began to purchase government issues in the medium, and later the long term area, to keep long yields down, while letting Treasury Bill yields rise to retain foreign short term balances in the U.S. The operation was considered a moderate success in some quarters, a failure in others, while yet others claim that as it succeeded in keeping long yields lower than they would otherwise have been, the policy attracted foreign borrowers to New York in increased volume, thereby increasing the outflow of long term capital. Long U.S. rates are among the cheapest in the world. Like the long Canada market, the U.S. Treasury levels perform a yardstick function for other borrowers.

The Bond Market - continued

Chairman Martin of the "Fed", testifying before a Joint Economic Committee of Congress, January 30, 1962, discussed the "Fed's" purchases since February, 1961, compared to the total volume of trade:

"In the five to ten year area, the proportion amounted to more than 20% for the year as a whole and in the period March through July was more than a third of the total. For securities maturing after ten years, official purchases comprised over 30% of all market purchases for the year, and nearly two thirds of total purchases in the second quarter, when the bulk of official purchases were made....."

Questions by committeemen, implying that the "Fed" should have made larger purchases, lowered long term rates further, produced the exchange, reported by the Goldsmith Nagan Service of Washington; reproduced in part as an appendix to this submission. (See Appendix I and Appendix II)

Mr. Martin's reply implied that he was afraid of destroying the long term market completely, by expanding the "Fed" operations beyond the share of the market mentioned above. He feared the permanent loss of some investors who had been "captive accounts", by custom, or by laws, which are now often being changed. (See Footnote to 105)

I digressed into this U.S. situation for a very good reason. Bank of Canada has always dealt beyond the short term market, sometimes when implementing monetary policy, for reasons connected with debt management, for government accounts or Trust Funds, in re-selling its draw-downs of new issues, and for motives which can only be guessed at other times, such as straightening the yield curve. I believe the Bank, by becoming such a large force in the market, has disrupted it and shrunk it, in the process acquiring a huge portfolio of long term issues which still overhang the market.^(F) It has "rigged" the market when it pleased, the most glaring example being the five point mark-up on the 1966 Victory issue during the Conversion. It virtually closed the market for two months, by capturing the dealer organization during the same Conversion. It exercised pressure on ultimate buyers during that Loan, and its control of dealer's allotments on new issues may discourage concerted criticism. It has had so many forces at its disposal that prudent souls

Chairman Martin of the "Fed", testifying before a Joint Economic Committee of Congress, January 30, 1962, discussed the "Fed's" purchases since February, 1961, compared to the total volume of loans: "In the five to ten year area, the proportion amounted to more than 20% for the year as a whole and in the period March through July was more than a third of the total. Appendix II)

Mr. Martin's reply implied that he was afraid of destroying the long term market completely by expanding the "Fed" operations beyond the share of the market mentioned above. He feared the permanent loss of some investors who had been "active accounts", by custom, or by laws, which are now often being changed. (See footnote to 10)

I digressed into this U.S. situation for a very good reason. Bank of Canada has always dealt beyond the short term market, sometimes in the long term market, in re-issuing its management, for government accounts or Trust Funds, in re-issuing its draw-downs of new issues, and for motives which can only be guessed at other times, such as straightening the yield curve. I believe the Bank, by becoming such a large force in the market, has disrupted it and when it, in the process of making a huge portfolio of long term issues which still overhang the market. It has "stayed" the market when it is needed, the most glaring example being the five point mark up on the 1960 Victory issue during the Convention. It obviously closed the market for two months, by capturing the dealer organization during the same Convention. It exercised pressure on ultimate buyers during that time, and the control of dealer's allotments on new issues may discourage new bond offerings. It has had so many forces at its disposal that market would

The Bond Market - continued

may well feel the longer Canada market is an artificiality to be avoided. (See also Footnote to 105). By comparison, the provincial markets seem relatively free from official domination, except as they reflect the Canada market. By comparison, the twelve month digression of the "Fed" into the medium-long bond market, an operation giving Chairman Martin grave doubts, is a relatively minor act compared with the Bank of Canada's interference over many years.

(113) During the War, national imperatives, public innocence of inflationary dangers, scarcities of goods and alternative investment, made the "rigged" government bond market "the only game in town". Now with alternative outlets for funds which are not too risky, plus the history of official interference in the marketplace, some investors may be avoiding the Canada market, with two exceptions, firstly, as short governments provide a satisfactory substitute for cash in the bank, and secondly as the medium or long market occasionally appears to be an attractive vehicle for essentially speculative funds.

(114) Complete rehabilitation of the long market may await the millenium, when inflationary psychoses, which cause lenders to demand penalty interest rates, may vanish; when government ceases to create new money in sufficient quantity to validate general rises in prices and wages, or to finance deficits on the grand scale now appropriate to election campaigns; when external pressures such as balance of payments deficits reveal that the printing press does not guarantee full employment, and that politicians in small countries are not sovereign for long when they violate sound economics. The balance of payments solution may come about when we face the world wide competition of cheap goods, made in nations with sound money.

(115) We could in the meantime attempt some rehabilitation of the market by making an honest woman out of it, by the scrupulous avoidance of official interference, actual or potential, even if this means cancelling the Bank of Canada's long portfolio,* reinstitution of limits on the Bank's long holdings, placing government trust funds at arms length with Bank and government, and letting the securities investment fund

* Until 1954 the Bank could hold over 10 year bonds to a limit of five times its capital and rest - i.e., \$150 million on today's basis. It actually holds \$1,186 millions.

any well known the long term market is an opportunity to be avoided.
(See also footnote to 105). By comparison, the provincial markets

* Until 1950 the Bank held over 10 years bonds to a limit of 10%
times the capital and reserves - i.e., \$100 million on 1000 million.
It actually holds \$1185 million.

The Bond Market - continued

operate openly through the Finance Department. Must we keep such a Fund, which can be a tool for official manipulation and interference with a free market, whatever its original purpose?

(116) We could cease having the Bank of Canada subscribe for all or part of new issues, only to dump them into the after market. It is already legally or ethically wrong for corporate borrowers to use affiliates in this fashion. While the King may be above the law, when he chooses a code of ethics denied to others by law or custom, he must expect to be considered a slippery fellow.

(117) We could restrict the Bank of Canada's open market operations, necessary to adjust chartered Bank reserves, to the bill or short term bond market, with arbitrage alone diffusing the effect through the longer market. Some deplore a government bond market without any official "friend" exposing it to a host of private speculative pressures. I happen to think that the private pressures would cancel themselves out by inciting trade at different times, at different levels, and at different volumes, according to the judgment of a few hundred or thousand individuals. I believe that the official "friend" has been abusing the market for its own ends for years. (F)

(118) It is not practical in Canada to have new issues underwritten by the few banks, but the U.S. practice often involves banks buying bonds, paying for them by crediting the Treasury with new deposits. These the Treasury withdraws over a week or three. In the meantime the individual bank may immediately sell the new bond at a loss, deriving greater benefit from the use of the new deposit, or it may sell it later, or keep it, as its position dictates. Since there are some 13,000 banks, these decisions made by individual "underwriters" -- thousands of them -- made a market in a way that the monolithic decision on a re-offering by one large underwriter -- the Bank of Canada for example -- never can, for the selling decision is in one set of hands.

(119) A "free bond market", with the government on one side, and the underwriters and lenders on the other, would be an arms' length situation, with the judgment of the marketplace setting the level. This is something of which officialdom seems afraid, and the penchant for meddling or "rigging" is an open admission of fear, fear of the judgment of a market,

The Bond Market -- continued

operate openly through the Finance Department. What we keep such a fund, which can be a tool for official manipulation and interference with a free market, whatever the original purposes?

We could cease having the Bank of Canada subscribe for all or part of new issues, only to dump them into the open market. It is almost legally or ethically wrong for corporate bondowners to use all this money in this fashion. While the King may be above the law, when he chooses a course of ethics denied to others by law or custom, he must expect to be considered a slippery fellow.

We could restrict the Bank of Canada's open market operations necessary to adjust chartered bank reserves, on the bill or short term market, with arbitrage alone eliminating the effect through the interest rate. Some develop a government bond market without any official "friend" exposing it to a host of private speculative pressures. I happen to think that the private pressures would cancel themselves out by increasing prices at different times, at different levels, and at different volumes, according to the judgment of a few hundred or thousand individuals. I believe that the official "friend" has been slowing the market for its own ends for years.

It is not practical in Canada to have new issues underwritten by the few banks, but the U.S. practice often involves banks buying bonds, paying for them by crediting the Treasury with new deposits. These the Treasury withdraws over a week or three. In the meantime the individual bank may immediately sell the new bond at a loss, deriving greater benefit from the use of the new deposit, or it may sell it later, or keep it, as its position dictates. Since there are some 13,000 banks, these decisions made by individual "underwriters" -- thousands of them -- made a market in a way that the monopolistic decision on a reservation by one large underwriter -- the Bank of Canada for example -- never can. For the selling decision is an act of banks.

A "free bond market", with the government on one side, and the underwriters and lenders on the other, would be an almost perfect situation, with the judgment of the marketplace setting the level. This is something of which officialdom seems afraid, and the penchant for meddling or "regulating" is an open confession of fear, born of the judgment of a market.

The Bond Market - continued

which must thus be captured somehow or other to do the government's bidding. All the excuses offered for fiddling, rigging, brainwashing, exhortation, etc., add up to a disbelief in the principles of a free market, among which is that borrowers want to get money cheaply, while lenders want the most they can get. ^(F)

(120) I believe that the borrower, the Government of Canada, is having difficulty in borrowing at long term in part because of its deficits, and in further degree because it has not left the market free from official interference. It is paying for its past sins. Canada presently is not growing noticeably faster than the United States, yet the spread in government bond yields is now far wider than the half of one percent of fifteen years ago in the long end, in the face of much more official interference here.

(121) Current trends carried forward for a few years of recurrent deficits suggest that governments may have to resort to regimentation (perhaps disguised as social security), or may be borrowing most of their money at short term, (a kiting of cheques as it were). At this point the nations creditors can force monetary expansion on governments by refusing to renew maturing issues, forcing government to resort to the banks, i.e., overt money creation.

(122) Thus I believe we must attempt to restore the Canada bond market to a position of freedom from official interference. After a period of recovery from a twenty year period of captivity, it may again become an area in which government can finance its needs, freely, and without suspicion. ^(F) (Excerpts from Radcliffe indicating some difficulties. See also Appendix IV.)

SAVINGS BONDS

(123) Between August 27, 1957 and February 7, 1962, the gross debt of Canada increased 26.5%, while the proportion represented by Savings bonds grew 82%. Savings bonds grew from 15.2% of the debt to 21.8% of the debt in this period. This \$4 billions in demand money constitutes a redemption threat.

(124) I believe this to be a good thing, rather than a bad thing, just like the growing body of short term government marketable debt. Like the demand deposits in a bank, the presence of creditors who can demand

which must thus be carried on other than the Government's bidding. All the expenses offered for lighting, heating, fire-insurance, etc., add up to a disbeliever in the principles of a free market, among which is that borrowers want to get money cheaply, while lenders want the most they can get.

I believe that the borrower, the Government of Canada, is having difficulty in borrowing at long term in part because of its deficits and in further degree because it has not left the market free from official interference. It is paying for its past sins. Canada presently is not growing noticeably faster than the United States, yet the spread in Government bond yields is now far wider than the half of one percent of fifteen years ago in the long end, on the face of much more official interference.

Current trends carried forward for a few years of recurrent deficits suggest that governments may have to resort to reorganization (perhaps disguised as social security), or may be borrowing most of their money at short term, (a kind of checkmate as it were). At this point no national creditworthiness can force monetary expansion on governments by refusing to renew maturing issues, forcing government to resort to the banks, etc.

(121)

Thus I believe we must attempt to restore the Canadian bond market to a position of freedom from official interference. After a period of recovery from a twenty year period of captivity, it may again become an area in which government can finance its needs, possibly on without expropriation. (17) (Excerpt from Babelite indicating some difficulties.)

(122)

Between August 24, 1967 and February 7, 1968, the gross debt

(123)

has been the subject of much discussion and has been the subject of much

(124)

The Bond Market - continued

their money at will, or in a short while, tends to impose a discipline on government.

(125) It might not be beneficial to have a large Conversion Loan in which short term claims against the government were consolidated, pushed off into the future, if the government again commenced a new build-up of short term debt.

(126) There is no valid reason why a prime credit, a government or a commercial bank, should fear redemption of large demand liabilities, unless it contemplates actions likely to bring its reputation into disrepute. Central Banks' objections would stress, of course, the contribution made to public liquidity.

CONFLICTS OF INTEREST

(127) The bond market too has conflicts of interest, which may work against the investor. When I entered the business we spoke of "clients", implying that a dealer, like a lawyer, primarily served his "client" ahead of other interests. This may have been a depression view, a reaction from the late 1920s, when dealers' heavy underwritings caused them to turn clients into customers, on whom the dealer unloaded merchandise just as a store or Fuller Brush man would. By the 1930s many of these securities were sour and many an innocent "client" who patronized an "honest broker" ended up as the "customer" of the broker's underwriting affiliate with a portfolio of the firm's issues, which the brokerage department would seldom advise him to sell. This condition still exists, with little recognition of the conflict of interest. The customer is no more sophisticated, perhaps, but economic conditions, and a little more care in selecting underwritings, have not produced the losses of the early thirties. It is probably a wrong concept, long ago banished in England, where brokers, jobbers and underwriters are different firms, seldom connected, each recognizable for what it is.

(128) With corporate issues the investment dealer may tend to stress the interests of the borrower (who could easily seek another underwriter) above those of the customer, or investor, (once called client) for there are more customers than issuing corporations!

(129) (There are exceptions, such as the borrowings of Ontario and the Ontario Hydro, where the issues long ago grew so large as to encourage the growth of one syndicate which contained almost all the large investment houses. These two borrowers must deal with the group since there are no

(126)

The bond market too has conflicts of interest, which may work against the investor. When I entered the business we spoke of "clients", implying that a dealer, like a lawyer, primarily served his "clients", ahead of other interests. This may have been a depression view, a reaction from the late 1920's, when dealers' heavy underwritings caused them to turn clients into customers, on whom the dealer unloaded merchandise (just as a store on Fuller Brush man would). By the 1930's many of these securities were sold on many an innocent "client" who patronized an "honest broker" ended up as the "customer" of the broker's underwriting affiliate with a portfolio of the firm's issues, which the brokerage department would seldom advise him to sell. This condition still exists, with little recognition of the conflict of interest. The customer is no more sophisticated, perhaps, but economic conditions, and a little more care in selecting underwritings, have not produced the losses of the early thirties. It is probably a wrong concept, long ago banished in England, where brokers, jobbers and underwriters are different firms, seldom connected, each recognizable for what it is.

(127)

With corporate issues the investment dealer may tend to stress the interests of the borrower (who could easily seek another underwriter) above those of the customer, or investor, (once called client) for there are more companies than leading corporations!

(There are exceptions, such as the borrowers of Ontario and the Ontario Hydro, where the issues long ago grew so large as to encourage the growth of one syndicate which contained almost all the large investment houses. These two borrowers must deal with the group since there are no

alternative groups obviously large enough to underwrite the issue. Smaller Provinces can resort to competitive tenders. Ontario seems happy with the present system; and its issues sell well.)

(130) In the Government of Canada market there is a similar conflict of interest to that in the corporate underwriting field. Bonds are offered by the Bank, less a commission (from 0.15% to 0.75%), to each dealer in a certain amount based upon his past activities in new Canada issues. It is true that sophisticated large investors will seldom pay the full price for these bonds, generally insisting on a trade whereby they obtain "over the market" for some other issue, thus obtaining often most of the dealer's "Commission".

(131) For those who deal in wholesale lots, the remaining 0.05% to 0.125% is quite profitable, though the whole commission concept is a bit of an illusion.

(132) The dealer however is very conscious that he gets an allotment of X% of a new issue from the Bank, and would risk having this reduced in subsequent loans should the Bank dislike his record of "distribution", whether in total or to some class of buyer (such as a bank, if Bank of Canada currently frowned on such sales). This places the dealers as captive sub-underwriters of the Bank, enjoying certain privileges "during good behaviour", enabling the Bank to wield considerable influence - in the minds of many dealers. It also tends to give the public the impression that the dealer is fundamentally the hired agent of the Bank or Government, rather than a free agent or honest adviser.

(133) The pressure exerted by some dealers during the Conversion Loan, the lack of complaint in public re-market rigging, and particularly the Investment Dealers' Advertisement urging Conversion, re-inforced this impression generally, while giving others the view that the dealers had allowed the generous commission to dull their critical faculties.

(134) I think this impression may be overly harsh, and would hope that dealers will learn to avoid such close and uncritical relationship with a borrower--particularly a Federal Government. Yet I can see a need for eliminating any chance of undue influence by Government or Bank on dealers, just as other examples of dealers favoring borrowers over investors should be deplored.

(135) I feel I can mention this because my firm doesn't deal with "the small investor", confining our efforts to dealing in Canada bonds with financial institutions, sophisticated large corporations, and of course our

alternative groups obviously large enough to underwrite the issue. Smallish
Provinces can resort to competitive tenders. Ontario seems happy with the
present system, and the issues sell well.)

In the Government of Canada market there is a similar conflict of
interest to that in the corporate underwriting field. Bonds are offered by
the Bank, less a commission (from 0.125 to 0.75%), to each dealer in a certain
amount based upon the past activities in new Canada issues. It is true that
sophisticated large investors will seldom pay the full price for these bonds,
generally insisting on a trade whereby they obtain "over the market" for some
other issue, thus obtaining often most of the dealer's "commission".

For those who deal in wholesale lots, the remaining 0.25% to 0.50% is
quite profitable, though the whole commission concept is a bit of an illusion.
The dealer however is very conscious that he gets an allotment of
1% of a new issue from the Bank, and would risk having this reduced in
subsequent loans should the Bank dislike his record of "distribution", whether
in total or to some class of buyers (such as a bank, if Bank of Canada currency
flowed on such sales). This places the dealer as captive and underwritten
of the Bank, enjoying certain privileges "during good behaviour", enabling
the Bank to wield considerable influence - in the minds of many dealers.
It also tends to give the public the impression that the dealer is fundamentally
by the hired agent of the Bank or Government, rather than a free agent or
independent adviser.

The pressure exerted by some dealers during the Convention loan,
the lack of complaint in public re-market trading, and particularly the
imposition generally, while giving others the view that the dealer had
allowed the generous commission to dull their critical faculties.

I think this impression may be overly harsh, and would hope that
dealers will learn to avoid such close and unbridled relationship with a
borrower - particularly a Federal Government. Yet I can see a need for
eliminating any chance of undue influence by Government or Bank on dealers,
just as other examples of dealers favoring borrowers over investors should
be deplored.

I feel I can mention this because my form doesn't deal with the
small investor, confining our efforts to dealing in Canada bonds with
financial institutions, sophisticated large corporations, and of course the

competitors in the industry, who are capable of making their own decisions.

(136) The solution I would suggest is that all Canada bond issues be offered at a net price, without commission, to all comers, with an honest, flat-percentage allotment on all orders above \$25,000-\$50,000 (which would "protect" the small investor -- for a guaranteed full allotment up to the \$25,000-\$50,000). The dealer who thought a new issue overpriced could refrain from subscribing without prejudicing his chance at the next issue which might be properly priced, or underpriced. The institution would have the same choice.^(F) This is roughly the U.S. method, and its only disadvantage is that a failure or near failure is very soon obvious, whereas our method buries failures between the almost mandatory subscriptions of dealers (to protect their position on future allotments) and the bonds swallowed by the Bank of Canada. Canadian issues are always "fully subscribed" or "over subscribed". The market may know broadly what has happened, but the public and Parliament seldom do.^(F) The U.S. system often reveals that $\frac{1}{3}$ of the public holders of a maturing issue spurned the refunding and took cash.

(137) One of the results of depressed bond prices over the past decade has been that the volume of trading by insurance companies has declined in part for book-keeping reasons. For instance a trade from Canada 3 1/4s due 1976 to Canada 3 1/4s due 1979 may have appeal at a cash "takeout" of 2 1/2 points. But, if the book value of the 1976s happens to be 100, a sale at market, a price of 83, immediately involves a "realized book loss" of 17 points which must be charged to this year's operations under current rules. This is enough to effectively rule out many trades of this nature. The inability to trade, when investment considerations make it attractive, primarily because of book-keeping drawbacks, tends to make the market thinner than it would otherwise be.

(138) Mathematically it also means that insurance companies are most likely to extend term when yields are low and bond prices high (since there are few or no book losses), while inhibiting such trades when prices are low, and yields high. If Canada 3 1/4s due 1976 were worth 100, as in the past, it is altogether likely that a trade into 3 1/4s due 1979 would involve a "pay-up" of half a point to a point, rather than the "take-out" mentioned above.

(139) Those who are slaves to yield books may be able to prove that the exchange where they pay out additional money is as good (or better) a deal than the same exchange where money is taken out, but common sense indicates otherwise.

...in the industry, who are capable of making their own decisions...
...offered at a low price, without consultation, to all owners, with an honest...
...first-purchase allowance on all orders above \$25,000-\$50,000 (which would...
..."protect" the small investor -- for a guaranteed full allotment up to the...
...\$25,000-\$50,000). The dealer who thought a new issue overpriced could...
...refrain from undersubscribing without paying his share at the next issue...
...which might be properly priced, or undersubscribed. The institution would have...
...the same choice. (7) This is roughly the U.S. method, and the only disadvantage

is that a failure or near failure is very soon obvious, whereas our method...
...purges failures between the almost mandatory subscriptions of dealers (to...
...protect their position on future allotments) and the bonds swallowed by the...
...Bank of Canada. Canadian issues are always "lightly subscribed" or "over...
...subscribed". The market may know broadly what has happened, but the yield...
...and Parliament seldom do. (7) The U.S. system often reveals that 1% of the...
...public holders of a maturing issue returned the refunding and took cash.

One of the results of depressed bond prices over the past decade...
...has been that the volume of trading by insurance companies has declined in...
...part for book-keeping reasons. For instance a trade from Canada 3 1/2% due...
...1976 to Canada 3 1/4% due 1979 may have equal at a cash "takeout" of 2 1/2...
...points. But, if the book value of the 1976s happens to be 100, a sale at...
...market, a price of 83, immediately involves a "realized book loss" of 17...
...points which must be charged to this year's operations under current rules...
...This is enough to effectively rule out many trades of this nature. The...
...inability to create, when investment considerations make it attractive...
...primarily because of book-keeping drawbacks, tends to make the market...
...thinner than it would otherwise be.

(137)

Mathematically it also means that insurance companies are most likely...
...to extend term when yields are low and bond prices high (since there are no...
...or no book losses), while liquidating such trades when prices are low, and...
...yields high. If Canada 3 1/4% due 1976 were worth 100, as in the past, it is...
...altogether likely that a trade into 3 1/4% due 1979 would involve a "pay-up"...
...of half a point to a point, rather than the "take-out" mentioned above.

(138)

Those who are slaves to yield books may be able to prove that the...
...exchange where they pay out additional money is as good (or better) a deal...
...than the same exchange where money is taken out, but common sense indicates

(139)

1
2
3 Surely there is an argument for amending the insurance act to
(140) 4 permit the trading of one Canada issue for another, with any "book loss"
5 being written into the new bonds. In the instance mentioned above (the
6 trade of 3 1/4s due 1976 for 1979 on 2 1/2 points "take out") the result
7 would be a new "book value" for 1979s at 97 1/2, as against the old book
value of 100 on 1976s.

8 This matter has been taken up with Ottawa before and has received
(141) 9 a favorable hearing in some quarters. It may have been turned down finally
10 by the Finance and Insurance Departments because some people wished to
11 extend the principle to Provincials and Municipals, which I agree would be
12 hazardous, since there have been occasions in the past when trades between
one Province and another, or between one municipal and another constituted
a definite downgrading of security.

13 These objections should not apply to exchanges of one Canada or
(142) 14 Canada guarantee for another bond of the same debtor. I believe that
15 anything of this nature, which enables trade to take place without
16 artificial barriers, would make for a broader and healthier market. (F)
EXCHANGE, BALANCES OF PAYMENTS ETC.

17 I have deliberately refrained from detailed comment on balance of
(143) 18 payments problems, exchange reserves, etc., though they affect the Bank of
19 Canada, the Finance Department and the bond market. They merit extended
treatment in themselves.

20 Yet Canada may some day need to orient its monetary policy in
(144) 21 directions dictated by these external forces, which can prove stronger than
the wishes and legislative enactments of the Parliaments of small nations. (F)

22 We may some day have a fixed exchange rate, by agreement with IMF,
(145) 23 or we may have a de facto stability in exchange rate because the authorities
24 wish to "peg" it approximately at some level. In these circumstances
25 inadequate exchange reserves may bring a monetary policy which is designed
26 to import short term funds from abroad by way of appropriate interest
rates. (F)

27 If this is ruled out by domestic considerations, then a fixed
(146) 28 dollar and low exchange reserves, plus a large balance of payments deficit,
29 may suggest a return of import controls or some form of exchange and
capital movement controls. (F) This would of course aid in financing the

100-100000

Federal Government by restricting the avenues for spending in a very tight economy, but it brings with it the inflationary consequences of restricting the presence of excess liquidity to the domestic economy.

in power -- into dual dispatch. Economically the stability or fragility of execution of economic policy, past or present, would be evident to many here and abroad. Legally the Government would be engaging in peacetime regimentation (to avoid the full price of its mistakes), which might invite evasion, avoidance and conservatism, bringing with it a further public disrespect for law and democratic government.

APPENDIX I

Digest of Testimony on THE PRESIDENT'S BUDGET & HIS ECONOMIC
REPORT, before the Joint Economic Committee, January, 1962
By Federal Reserve Board Chairman, Wm. McC. Martin
as reported by the Goldsmith-Nagan Service

Senator Proxmire: "You seem to imply that you couldn't have played a much more aggressive role with regard to obligations of five to ten years and ten years and over because you were already such a big factor in the market. That is, when you account for 20% of the trading, you might feel that if you did any more you would destroy freedom in the market. Would that be correct?"

Mr. Martin: "That is correct. It is always a matter of judgment. I think we went as far as we could in this -- as far as we were warranted."

Senator Proxmire: "There are just two things that bother me about this. In the first place, when you are this big a factor it seems to me that you can play a really important part so far as the economy is concerned in lowering interest rates on long term obligations, to the great benefit of the economy. In the second place, I notice, for example, between June and September, the Treasury Department purchased \$1 billion of additional long term securities, apparently, or at least they advised government agencies and trust funds to do so, while the Federal Reserve increased their portfolio relatively slightly, \$63 million, which is small for that."

Mr. Martin: "Well those trust accounts were being invested for longer term reasons. The last thing that the Federal Reserve ought to do in my judgment is to destroy the long term market. We want to sell long term Treasury bonds, and we want a good long term market. There is the very nature of the long term market. A lot of people seem to think that these long term securities are just here on a shelf the way they are in a grocery store, and that you can just go up and grab some of them. Here is a pension fund in a trust account that hasn't any intention of selling a long term Government security. You don't have too many of those people left in this country. You start playing around with that market and after a while, the first thing you know, you have no market. We got up to 33% of dealing in that market, we haven't been faced with the problem of selling. I think we have gone as far, and this was a matter of judgment that weighted heavily with the Federal Reserve open market committee in its discussions every three weeks, we have gone very far in attempting to disperse throughout the market, without trying to control or make the market or return to fixed interest rates."

Senator Proxmire: "But the difficulty is that your additional purchases have been concentrated very largely in the one to five year category. As far as the impact on housing loans -- the area where monetary policy is it seems to me most constructive, useful and encouraging -- these are much longer term and we still have these relatively high interest rates compared to most of the past periods."

Mr. Martin: "I have tried to emphasize repeatedly here that it is the flow of funds that we are concerned with, and I think the record of the second quarter indicates that we were quite successful on the flow of funds because we had a record number of state, municipal and other securities floated in that period with a maximum of stability in interest rates. In other words, we did have some (increase in rates). I never claim too much because arbitrage does occur in the markets, and we are not in a position to fix rates unless we become the market entirely and put ourselves in the position where the way the government sells its securities is to sell them to itself, which I think is a very unfortunate thing... We were successful in having a strong flow of funds in the second and their quarter of this year, in the longer term market. I believe our activities and the Treasury activities made some contribution to that."

APPENDIX I

PICASSO OF TESTIMONY ON THE PRESIDENT'S BUDGET & HIS ECONOMIC REPORT, before the Joint Economic Committee, January, 1968
By Federal Reserve Board Chairman, Mr. McV. Martin
as reported by the Goldsmith-Negron Service

Senator Brockmeyer: "You seem to imply that you couldn't have played a much more aggressive role with regard to obligations of five to ten years and ten years and over because you were already such a big factor in the market. That is, when you account for 30% of the trading, you might feel that if you did any more you would destroy freedom in the market. Would that be correct?"

Mr. Martin: "That is correct. It is always a matter of judgment. I think we went as far as we could in that -- as far as we were warranted."

Senator Brockmeyer: "There are just two things that bother me about this. In the first place, when you are this big a factor it seems to me that you can play a really important part so far as the economy is concerned in lowering interest rates on long term obligations, to the great benefit of the economy. In the second place, I notice, for example, between June and September, the Treasury Department purchased \$1 billion of additional long term securities, apparently, at least they advised government agencies and trust funds to do so, while the rest of the market was doing nothing. Is that right?"

Mr. Martin: "Well those trust accounts were being invested for longer term securities. The last thing that the Federal Reserve ought to do in my judgment is to destroy the long term market. We want to sell long term Treasury bonds, and we want a good long term market. There is the very nature of the long term market. A lot of people seem to think that these long term securities are just here on a shelf the way they are in a grocery store, and that you can just go up and grab some of them. We got up to 3% of dealers in that market, we haven't been faced with the problem of selling. I think we have gone as far, and this was a matter of judgment that weighed heavily with the Federal Reserve open market committee in its discussions every three weeks, we have gone very far in attempting to disperse throughout the market, without trying to control or make the market or return to fixed interest rates."

Senator Brockmeyer: "But the difficulty is that your additional purchases have been concentrated very largely in the one to five year category. As far as the impact on housing loans -- the area where monetary policy is it seems to me most constructive, useful and encouraging -- these are much longer term and we still have these relatively high interest rates compared to most of the past period."

Mr. Martin: "I have tried to emphasize repeatedly here that it is the flow of funds that we are concerned with, and I think the record of the second quarter indicates that we were quite successful on the flow of funds because we had a record number of state, municipal and other securities floated in that period with a maximum of stability in interest rates. In other words, we did have some (increase in rates). I never claim too much because what does occur in the market, and we are not in a position to fix rates unless we become the market entirely and put ourselves in the position where the way the government sells its securities is to sell them to itself, which I think is a very unfortunate thing. We were successful in having a strong flow of funds in the second and third quarters of this year, in the longer term market. I believe our activities and the Treasury activities made some contribution to that."

APPENDIX II

"The Federal Reserve System", (Harper, New York, 1960) contains a chapter on open market operations by C. Richard Youngdahl, one of the leading New York government security dealers. In part:-

"The practice of dealing only in short term securities was adopted formally in 1953, following a broad enquiry by an Ad Hoc Subcommittee of the Federal Open Market Committee....headed by the Chairman of the Board of Governors....shortly after the Federal Reserve discontinued its practice of interfering directly in both the long and short term sectors of the market.. This intervention, the subcommittee found, had left its mark on the government securities market....there remained an uncertainty about system intentions that was detrimental to the...."depth, breadth and resiliency of the market". The subcommittee recommended..that the System confine its operations to very short term securities, preferably bills, where the direct impact....on the market would be at a minimum.. It also recommended... instructions...to make it clear that the System did not intend to interfere lightly in the long term market under the guise of "maintaining orderly markets"....such action is to be taken only to correct a "disorderly situation"....after other measures have failed.

Prior....it had been the practice of the Federal Reserve to intervene...to support "rights" values on maturing securities during a....refunding. The subcommittee found this practice detrimental of the efficient operation of the....market and to run counter to....formulation and execution of credit and monetary policy. It recommended that the practice of direct intervention to support...refinancing operations be discontinued, leaving the Treasury to insure....success...by the proper pricing of its new offerings....

Since that time the System has only once....intervene(d) in the long term market because of disorderly market conditions....The capital market no longer expects, wants or needs such intervention

It is of course always tempting to advocate direct Government interference with market processes in order to substitute official judgment for that of the market place....The basic questions raised in opposition...are rather whether the monetary authorities would be prepared to accept the disruption in the private capital markets that such action might engender, whether these markets then could satisfactorily function...and whether the Treasury under such circumstances could finance in any size outside the short term area....."

The Federal Reserve System" (January, New York, 1960) contains a chapter on the Federal Reserve System, and a chapter on the Federal Reserve System, and a chapter on the Federal Reserve System.

"The practice of dealing only in short term securities was adopted formally in 1923, following a broad enquiry by the Federal Reserve Committee of the Federal Open Market Committee, headed by the Chairman of the Board of the Federal Reserve System."

..... This intervention, the Subcommittee found, had left the mark on the government securities market.... there remained an uncertainty about whether intentions that was detrimental to the.... depth, breadth and resiliency of the market. The Subcommittee recommended.... that the System continue its operations to very short term securities, primarily bills, where the direct impact.... on the market would be at a minimum. It also recommended.... instructions.... to make it clear that the System did not intend to intervene lightly in the long term market under the guise of "maintaining orderly markets".... such action is to be taken only to correct a "disorderly situation."

..... it had been the practice of the Federal Reserve to intervene.... to support "liquidity" under the practice of the efficient operation of the Subcommittee found this practice detrimental to the efficient operation of the market and to the character of the.... formulation and execution of credit and monetary policy. It recommended that the practice of direct intervention be discontinued, leaving the Treasury to manage.... by the proper pricing of its new offerings....

Since that time the System has only once.... intervened in the long term market because of disorderly market conditions.... The capital market no longer expects, wants or needs such intervention....

It is of course always tempting to advocate direct Government intervention with market processes in order to substitute official judgment for that of the market place.... The basic question raised in opposition.... are whether the monetary authorities would be prepared to accept the dislocation in the private capital markets that such action might engender, whether there markets then could satisfactorily function.... and whether the Treasury under such circumstances could finance in any case outside the short term area....

APPENDIX III

"HOUSE OF COMMONS, CANADA, MINUTES OF EVIDENCE # 10.
STANDING COMMITTEE ON INDUSTRIAL RELATIONS, June 9, 1959"

(Part of exchange between Hon. Paul Martin and Mr. James E. Coyne, Governor
of the Bank of Canada and member of the Investment Committee of the Unemploy-
ment Insurance Fund. (Page 365-6))

Mr. Coyne: "The unemployment insurance fund held about \$300 millions of Victory
bonds....all of which bore 3% coupons...They converted them in accordance with
the options made available by the government....It was in the interests of the
fund to convert from a 3% to a 4 1/4% bond....over the long view the major
benefit to the unemployment insurance fund....was getting a higher interest rate.

There are, I think, two further points...in relation to your question: instead
of converting, it should have sold its Victory bonds, or perhaps, after convert-
ing, it should have sold its conversion bonds earlier on. The fund could not
possibly have sold their entire holdings. It was much too large for the
market to take. It would have ruined the market, and been disadvantageous to
the fund to try to sell....."

Mr. Martin: "Was there not a period from July to the end of October when
the bank maintained the market and the price of the converted bonds and victory
bonds?"

Mr. Coyne: "Yes the bank made a two way market and it was active....However
the bank was not there holding a basket for anyone to take advantage of. We were,
we hoped, running a two way operation and assisting investors who were out of
balance and wanted to sell some part of their holdings....."

There was no way the unemployment insurance fund could have sold a large
quantity of bonds at that time. If the banks or insurance companies, or anyone
else, has said they were going to dump huge quantities on the market, it would
have been a smash, and they did not do so. I do not think the unemployment
insurance fund could have either."

Mr. Martin: "...It would have been possible to sell the victory bonds of the
commission rather than have them converted, would it not?"

Mr. Coyne: "No, it would not."

Mr. Martin: "Why would it not?"

Mr. Coyne: "In my judgment you could not have found sufficient buyers for
\$300 millions worth of Victory bonds."

Mr. Martin: "Well, assuming that was not the case, there was no obstacle,
apart from that, to prevent you from selling the victory bonds, rather than
converting them."

Mr. Coyne: "There was no obstacle, other than our best investment judgment..."

(This bears on conflicts of interest between the Bank of Canada's responsibili-
ties, and on the question of who were the sellers of Victory bonds and/or
Conversion bonds in large blocks during and just after the Conversion Loan.
Were there any sellers whose collective holdings approached in size the \$300
millions owned by Unemployment Insurance? If so, did the public interest
demand that they be given a privilege of which UIF considered itself
incapable of exercising? AHC)

STANDING COMMITTEE ON INDUSTRIAL RELATIONS, JUNE 9, 1952
"HOUSE OF COMMONS, CANADA, MINUTES OF EVIDENCE # 10."

part of exchange between Hon. Paul Martin and Mr. James E. Coyne, Governor
of the Bank of Canada and member of the Investment Committee of the Unemploy-
ment Insurance Fund. (Page 365-6)

One...all of which bore 3% coupons...They converted them in accordance with
the options made available by the government...It was in the interests of the
fund to convert from a 3% to a 4 1/2% bond...over the long view the major
benefit to the unemployment insurance fund...was getting a higher interest rate.

There are, I think, two further points...in relation to your question: instead
of converting, it should have sold its Victory bonds, or perhaps, after convert-
ing, it should have sold its conversion bonds earlier on. The fund could not
possibly have sold their entire holdings. It was much too large for the

the fund to try to sell....."

Mr. Martin: "Was there not a period from July to the end of October when
the bank maintained the market and the price of the converted bonds and victory
bonds?"

Mr. Coyne: "Yes the bank made a two way market and it was active....However
the bank was not there holding a basket for anyone to take advantage of. We were
we hoped, running a two way operation and assisting investors who were out of
balance and wanted to sell some part of their holdings....."

There was no way the unemployment insurance fund could have sold a large

have been a smash, and they did not do so. I do not think the unemployment
insurance fund could have either."

Mr. Martin: "...It would have been possible to sell the victory bonds at the
conversion rather than have them converted, would it not?"

Mr. Coyne: "No, it would not."

Mr. Martin: "Why would it not?"

Mr. Coyne: "In my judgment you could not have found sufficient buyers for
\$500 million worth of Victory bonds."

Mr. Martin: "Well, assuming that was not the case, there was no obstacle,
could you prevent you from selling the victory bonds, rather than
converting them?"

Mr. Coyne: "There was no obstacle, other than our best investment judgment...."

(This bears on conflicts of interest between the Bank of Canada's responsibility
and on the question of who were the sellers of Victory bonds and/or
conversion bonds in large blocks during and just after the conversion loan.
There were many sellers whose collective holdings approached in size the \$500
million owned by the unemployment insurance fund. If so, did the public interest
demand that they be given a privilege of which the fund itself
inquiries of exonerate? AMO)

APPENDIX IV

(EXCERPT FROM ARTICLE BY A.H. CAMERON, OCTOBER, 1957)
ENTITLED: HIGH LONG TERM INTEREST RATES!)

CAN CENTRAL BANKS FORCE LOW INTEREST RATES ON A MARKET? DOCTOR DALTON.

England provides two examples of unsuccessful attempts to place bond issues at rates of interest which were contrary to general public expectations.

After successfully maintaining roughly a 3% interest rate during the war, Chancellor Dalton decided he should drive long term interest rates down to 2½% or less. Accordingly he took every opportunity to revise the public expectations by propounding his view that interest rates were too high and he was going to be successful in lowering them. He then lowered the Treasury bill support rate by 1/2%, and in short order "Consols" rose in price, declining to a 2-3/4% yield.

As Prof. F. W. Paish says, on this matter "So long as interest rates are falling and prices...are rising, the movement will be assisted by those who hope for capital profits from its continuation", especially those whose high tax brackets made sixpence of capital gain worth £1 of interest. In other words the speculators got aboard Dr. Dalton's band wagon. Many INVESTORS doubted if less than 3% was a fair rate of interest.

It proved difficult to drive rates from 2-3/4% to 2½% as skeptical investors sold, preferring cash. Dalton had Government accounts (controlling over 3 billion pounds) buy in the bonds, and push up the market, unloading Treasury bills as they did so. Banks bought the Treasury bills, creating new deposits which, via the government accounts, went into the hands of the sold-out investors. The Bank of England created the necessary reserves to support the expansion in bank deposits. The Bank of England had just been nationalized.

There were so many skeptical bondholders who preferred cash, that the resultant stuffing of bills into banks, and deposit expansion, was dangerously inflationary. The Government got "cold feet". The market wobbled, the speculators took their profits and the government accounts were left holding the long term issues. In principle the attempt was similar to the Federal Reserve's "pegging", but at increasing prices.

The aftermath was a shrunken long term bond market in Britain, and recognition that a market "made" by government accounts was not only "rigged", but could only stay "rigged" at the cost of what was really the printing of vast quantities of money. The "rentier" examined the plans for his euthanasia, didn't like them, and abandoned "gilt-edged" in marked degree. (This almost unbelievable story is abridged from "Modern Banking" by R.S. Sayer of the London School of Economics, 1953 Edition).

Sayers, in a footnote, claims Parliament knew Trust Funds were being used to manipulate the market, but took no action.

Though Dr. Dalton's ill fated 2½s sold as low as 36½ in 1961, there is little hint of this episode in "Radcliffe". The impression that British markets are resigned to official domination, and that few have the "free market" concept still extant in the U.S., may be an unfair judgment. Yet if it has any validity, could this be one of the reasons for the malaise in British gilt-edged over the decade and a half following Dalton? See also Sir Roy Harrod's comment Footnote #119.

Though Canadians, officials of institutions, seldom complain publicly about official coercion, many may have quietly engaged in overt market activities which evidence such displeasure. It might be difficult to duplicate the Conversion Loan of 1958. AHC

(EXCERPT FROM ARTICLE BY A. H. HAMMOND, OCTOBER, 1937)

BANKS FOR THE LOW INTEREST RATE ON A MARKET DOCTOR

England provides two examples of unsuccessful attempts to place loans at rates of interest which were contrary to general public expectations. After successfully maintaining roughly a 3% interest rate during the war, Chancellor Dalton decided he must drive down interest rates down to 2% or less. Accordingly he took every opportunity to reverse the policy of expansion by propounding his view that interest rates were too high and no longer going to be successful in lowering them. He then lowered the Treasury bill support rate by 1/8%, and in short order "Consols" rose in price, reaching a 2-3/4% yield.

As Prof. F. V. Bates says, on this matter "So long as interest rates are falling and prices... are rising, the movement will be assisted by those who hope for capital profit" is from the "consolidation", especially those whose capital brackets make a profit of capital gain out of interest. In other words, less than 3% was a fair rate of interest.

It proved difficult to drive rates from 2-3/4% to 2% as suggested. Over 3 billion pounds) buy in the bonds, and when up the market, realizing interest bills as they did so, bank bought the Treasury bills, resulting in deposits which, via the government accounts, went into the hands of the holding investors. The Bank of England created the necessary reserves to cover the expansion in bank deposits. The bank of England had just been reorganized.

There were so many speculative bondholders who preferred cash, that the resultant standing of bills into banks, and deposit extensions, was correspondingly inflationary. The Government got "cold feet". The market was soiled, and speculators took their profits and the government accounts were left with the loss term losses. The principle the attempt was made to the Federal Reserve, "pegging", but at increasing prices.

The aftermath was a shrouded long term bond market in England, and recognition that a market "made" by government accounts was not only "pegged", but could only stay "pegged" at the cost of what was really the printing of vast quantities of money. The "tentative" examined the plans for the new bank didn't like them, and abandoned "cold feet" in market losses. This situation inevitably story he studied from "Money Banking" by H. B. Meyer on the London

However, in a footnote, Sir James Buchanan, now Lord Justice of Appeal, used to manipulate the market, but took no action.

Though Dr. Dalton's ill-fated attempt to drive rates down to 2% is a little hint of this episode in "Money Banking". The important point is that the market are required to official connections, and that the new bank was not a market, but a central bank in the U.S., may be an unwise judgment. It is not clear why validity, could this be one of the reasons for the market in England, that the new bank and a bank in England, Dalton, see also the following article.

Though James Hann, officials of institutions, before a market possibly about official central banks, many may have possibly engaged in such market activities with evidence such as "Money Banking". It might be interesting to compare the Convention Journal 1938, and

Paragraph #4

Though Keynesian ideas of contra-cyclical deficits may account for the degree of monetary expansion in 1957-62, Ludwig Von Mises suggests another cause in the 1953 edition of "The Theory of Money and Credit", pages 426-8, which is tenable to students of political psychology.

Von Mises argues that politicians, though rejecting the ideas of inflationist quacks, though aware that inflation is self defeating, can nevertheless justify actions which cause inflation by claiming that the nation faces other evils much more dangerous.

Von Mises suggests a situation where government, supported by a minority, sees an emergency justifying large increases in public spending and corresponding austerity in private spending. But the majority of the people either disagree as to the seriousness of the situation, or are unwilling to pay increased taxes. Von Mises suggests that government then rejects the democratic way of persuading the majority, and assumes the right and power to circumvent the majority by deceiving the public as to the costs involved. Though complying with legal processes, government then changes its role from that of elected officeholders to guardians of the people -- Fuhrers, if you like. To quote:-

"...the majority...(is) not prepared to defray the costs incurred by their rulers' policies. They support these policies only to the extent that they believe their conduct does not burden themselves. They vote...only for such taxes as are to be paid by other people...because they think that these taxes do not impair their own material well being. The reaction of the government... is, at least sometimes directed by the sincere wish to serve what it considers to be the true interests of the people...But if the government resorts for this purpose to inflation, it is employing methods...contrary to the principles of representative governmenttaking advantage of the masses' ignorance....cheating the voters instead of trying to convince them.

"It is not just an accident that...inflation has become the accepted method of monetary management. Inflation is the fiscal complement of statism and arbitrary government...a cog in the complex of policies and institutions which gradually leads toward totalitarianism...."

A cynic might suspect that the "emergency" justifying some deficit spending was merely the imminence of an election..AHC.

Paragraph #5

"RADCLIFFE EVIDENCE" (Vol. 2, Para 42 of submission by Issuing Houses Association:- "If monetary controls have not been as effective as they were before the War, the cause may lie in:-

1. The high level of taxation...has reduced the effectiveness of small changes in the rate of interest. Providing profits are being made, the effective cost....is....the net rate after tax.
3. The redistribution of income from the saving classes to the spending classes has...increased the velocity of circulation and added an unknown amount to the effective money supply..."

Paragraph #6

"GRAHAM TOWERS", Toronto, January 25, 1962, at Canada Life meeting:- "But international conditions have been changing rapidly since 1956, and we have to compete with a number of major countries which, so far at least, appear to have had relative success in keeping their costs of production in line. When this situation gives rise to unused capacity and unemployment in the higher cost countries, attempts to stimulate the economy by public spending and monetary expansion can hardly be regarded as effective long term solutions....."

Though Keynesian ideas of counter-cyclical deficits may sound like the device of monetary expansion in 1930-32, Irving V. Brown suggests another source in the 1932 edition of "The Theory of Money and Credit", pages 156-8, which is devoted to studies of

Von Mises argues that politicians, though watching the issue of inflationist crises, "soon aware that inflation is self-defeating, can nevertheless justify actions which cause inflation by claiming that the nation faces otherwise much more dangerous."

Von Mises suggests a situation where government, supported by a minority, uses an emergency justifying large increases in public spending and corresponding authority in private spending. Then the majority of the people either acquiesces as to the restoration of the situation, or are unwilling to pay increased taxes, and thus suggests the government then restore the democratic way of government, and assumes the right and power to eliminate the majority by dissolving the public as to the vote itself. The majority with legal procedure, government then assumes the role from that of elected officials to governments of the people -- namely, it is not the people.

"... the majority... (a) not prepared to betray the cause... by their voters' policies, they support these policies only to the extent that they believe their conduct has no impact on themselves. They vote... they vote as one to be paid by other people... because they think that those taxes do not impact on their own material well-being. The result of the government... is at least somewhat affected by the voters who do vote with it consent to be the true basis of the government... in the government... contrary to the principles of representative government... taking advantage of the masses' ignorance... observing the voters instead of trying to convince them

"It is not that an individual... inflation has become the accepted means of monetary management. Inflation is the direct complement of expansion and inflationary government... a tool in the complex of policies and institutions which gradually make economic

A cyclic might suggest that the "emergency" justifying some inflationary spending was merely the immediate of an economic crisis.

"RABBITHOLE TWENTY" (Vol. 2, Part 2 of "The Economics of Inflation") - "If monetary expansion does not have an objective as they have before the war, the cause is the inflationary

1. The high level of taxation... has reduced the effectiveness of small changes in the rate of interest... inflationary profit and wage rates, the effective cost... the inflationary tax.

2. The redistribution of income from the saving classes to the spending classes has... increased the velocity of circulation... and added an inflationary element to the inflationary money supply.

"GRAHAM TOWERS", Toronto, January 22, 1961, at annual meeting: "The international community have been largely unhelpful since 1945 and we have to compete with a number of... countries which, so far as I know, appear to have had... success in keeping their rates of production in line with the... situation gives rise to increased capacity and unemployment in the... higher cost countries, attempts to achieve the necessary... spending and monetary expansion and inflationary... effective long term inflationary..."

FOOTNOTES TO:

Paragraph #6
(continued)

"GRAHAM TOWERS", Speech at Toronto, November 9, 1950:-

"...If one sets aside the war debts of certain countries, it is true to say that Canada has a larger foreign debt than any country in the world....a large part of which is composed of marketable securities, (which) does mean that we are exposed to swings in foreign opinion. If non-residents, particularly residents of the United States, take a dark view of the Canadian picture, they can give effect to that view by selling some of their tremendous holdings of Canadian market issues, and withdrawing their capital from Canada...."

The portfolio investments of foreigners in Canada were \$4.7 billions at the end of 1950, and \$9.5 billions at the end of 1960. Source, Bank of Canada..AHC.

Paragraph #9

"FEDERAL DEBT", Page 206-7, "...as the government needed more funds, the country experienced a species of double talk. The Treasury repeatedly professed that it did not want the banks to buy bonds, for this would inflate the money supply. It wanted its securities bought only by savers, since these would reduce their own personal expenditures as the government increased its own. It is true that even when savers bought bonds, they received relatively liquid assets, which they might later decide to redeem or sell....."

Unfortunately for this theory, the desire of the government for easy financing required that the banks possess excess reserves.... But banks with excess reserves naturally seek the liquidity and income that come from investing them in government securities... The net result was that the money supply increased from \$65 billion in 1939 to \$165 billion in 1946...a new and sophisticated king of greenbackism...."

This wartime parallel is of interest because of Canada's deficit financing of 1958-62, largely resulting in dollar-for-dollar increase in the money supply. At times the authorities discourage the buying of certain issues by banks, and at other times tried to sell bonds to the public against existing savings..AHC.

Paragraph #23

"LORD NORMAN", Sir Henry Clay, 1957:- "Though quite as independent by disposition as Cunliffe, Norman had learned from experience the necessity of carrying with him, through their representatives on the Committee, both the Court and the City community outside.... For urgent business, if important enough, a special meeting would be convened, or, if that was not practicable, a meeting of such members as could be got together. In the Committee again, he found his chief advisers and helpers, though these were always in addition to one or two of the Clearing Bank chairmen or general managers and partners in the larger private banking houses on whose advice he relied. While he was still Deputy-Governor he arranged for a weekly meeting with the Chairman of the Discount Market Committee and in practice he saw successive chairmen of the Stock Exchange Committee almost as regularly....."

Paragraph #27

"GRAHAM TOWERS". Speech at Toronto, Jan. 6, 1936: "There is a school of thought...which regards a Central Bank as an institution unlikely to do much good, but I do agree that a Central Bank in undesirable hands would be dynamite indeed. It could so easily become of real significance in ways which would constitute the greatest injustice. It is desirable that there should be a sounder knowledge of Central Bank operations...the main factors. Enlightened public opinion is the greatest safeguard a Central Bank can have....."

Paragraph #29

"MODERN BANKING" (R.S. Sayers, Oxford 1953) page 59. "The authority of the State over the Central Bank is always necessarily absolute. All that is open to question is the extent to which the sovereign body should detail its commands to the Central Bank--for the monetary laws are such commands."

"...If one adds the non-bank of certain countries, it is true to say that Canada has a larger foreign debt than any country in the world.... a large part of which is composed of monetary securities, (which) does mean that we are exposed to swings in foreign opinion. If non-residents, particularly residents of the United States, take a dark view of the Canadian picture, they can have effect to that view by selling some of their investments holdings of Canadian market issues, and withdrawing their capital from Canada...."

The portfolio investments of foreigners in Canada were \$4.7 billion at the end of 1960, and \$2.5 billion at the end of 1965. Source, Bank of Canada, ABC.

Canada, the country experienced a period of double-digit inflation. Treasury reportedly protested that it did not want the banks to buy bonds, for this would inflate the money supply. It wanted the securities bought only by savings, since these would remove them from personal expenditure as the government increased its own. It is true that even when savings bonds were bought, they were relatively liquid assets, which they might later decide to redeem or sell....

Unfortunately for this theory, the desire of the government for easy financing combined that the banks possess excess reserves. But banks with excess reserves naturally seek the liquid and income that come from investing them in government securities. The net result was that the money supply increased from \$65 billion in 1959 to \$100 billion in 1960.... a new and sophisticated kind of credit expansion...."

This wartime period is of interest because of Canada's debt financing of 1945-46, largely resulting in dollar-for-dollar increase in the money supply. At times the monetarist discipline of certain issues by banks, and at other times tried to sell bonds to the public against existing savings, ABC.

"JONAS NORMAN, Sir Henry Clay, 1957- "though, during an independent by disposition as Gaultier, Norman had learned from experience the necessity of carrying with him, through their representatives on the Committee, both the bank and the City community.... For recent business, it is important enough, a special meeting would be convened, or, if that was not practicable, a meeting of such members as could be got together. In the Committee again, he found his chief advisers and helpers, though these were always in addition to one or two of the leading Bank officers or general managers and partners in the larger private banking houses whose advice he sought. While he was still Deputy-Governor he was named for a weekly meeting with the chairman of the Board of Directors and in practice he was a successful chairman of the Stock Exchange Committee almost as regularly...."

"JOHANN TOWERS". Speech at Toronto, Jan. 6, 1960. "There is a school of thought... which regards a central bank as an institution unlikely to do much good, but I do agree that a Central Bank is undesirable in that it would be dynamic instead. It could be easily become of real significance in ways which would be a blow to the greatest of nations. It is desirable that there should be a bank of knowledge of Central Bank operations, the main point. Enlightened public opinion is the greatest asset of a Central Bank...."

"MODERN BANKING" (R.S. Bayart, Oxford 1960) page 10. "The importance of the issue over the Central Bank is a very good example. Absolute. All that is open to question is the extent to which the monetary body should detail the conduct of the Central Bank for the monetary laws are such commands."

FOOTNOTES TO:

Paragraph #29

"THE FEDERAL RESERVE SYSTEM" (Harper, N.Y. 1960) page 19, states:
"The intent of the Congress....was that the Federal Reserve....
should be independent....not independent of Government, but
independent within the general structure of Government. This does
not mean that the system can or should pursue a course....contrary
to....national economic policies, but....within the framework of
those general objectives, it is to have freedom to exercise
its....judgment independently."

"THE RESERVE BANKS AND THE MONEY MARKET"

(Randolph Burgess, Harper, N.Y. 1946 edition, Preface)

"The principal change has been wartime subordination of Central
Banks to Treasuries in all countries. The principal question is
how much independence they will regain."

Since the Kennedy regime's installation there has been discussion
of an amendment to the Federal Reserve Act, making the term of
the Chairman co-incide with that of the President. A.H.C.

Paragraph #30

"RADCLIFFE EVIDENCE". (Vol. 2, para. 50 of submission by the
Accepting Houses Committee) - "...if an official request remains
in force for too long it may have an effect entirely different
from that which the authorities intended. An example (is) the
requests....made to the banking community to restrict advances....
to hire purchase finance companies...(which) have now had the
effect of stimulating such companies to invite direct deposits
by....the public."

Paragraph #33

"RADCLIFFE REPORT", para. 942...."....We recommend....that the
banks should....offer term loan facilities within reasonable
limits....as an alternative to a running overdraft for credit-
worthy industrial and commercial customers...."

Paragraph 58.

"BANK OF CANADA REPORT, 1956", Page 23:- "The job of a Central
bank is to manage the money supply in such manner as to contribute
both to economic growth and to stability of prices. It can make
its contribution, and use its influence, but it cannot ensure the
total achievement of either objective."

Paragraph #59

"BECKONING FRONTIERS", (Marriner Eccles, Knopf, N.Y., 1951)
Page 494, contains the following anent Treasury attempts to con-
tinue "Pegged" bond prices:- "...a final move in a Treasury
attempt to impose its will on the Federal Reserve. If swift action
was not taken....the Federal Reserve would no longer have a voice
in deciding monetary and credit policies. It would lose the
independent status Congress meant it to have, and, in its most
important function of open market operations, it would be reduced
to the level of a Treasury bureau."

The "Fed" regained its freedom in 1953...AHC.

Paragraph 62.

"McLAURY", Page 38:- "In summary then, the Bank of Canada entered
the 1950s with a long history of successful open market operations
in government securities. This "success", however, was based
solely on experience during periods when it had not been necessary
to use such operations to implement a restrictive monetary policy.
The bond market was well developed, partly as a result of the
Bank's own efforts, but the Bank's dominant position in this market
restricted its freedom of action."

Paragraph #67.

"BANK OF CANADA REPORT, 1958", Page 3-4:- "...the Canada Con-
version Loan of 1958 made possible a return thereafter to non-bank
financing of Government bond issues and a halting after early
October of the monetary expansion which had been necessary to that
time." Page 5:- "The reform of the structure of the Government
debt, and the contribution it made to improving conditions for the
sale of future issues....to non-bank investors, were important
elements in monetary policy in the broadest sense and an essential
anti-inflationary achievement."

"THE FEDERAL RESERVE SYSTEM" (Hanson, N.Y. 1960) page 19 states: "The intent of the Congress... was that the Federal Reserve... should be independent... not independent of Government, but independent within the general structure of Government. This does not mean that the system can or should pursue a course... contrary to... national economic policies, but... within the framework of those general objectives, it is to have freedom to exercise its independent judgement."

"THE RESERVE BANKS AND THE MONEY MARKET" (Randolph Burgess, Harper, N.Y. 1946 edition, Preface) "The principal change has been wartime subordination of Central Banks to Treasuries in all countries. The principal question is how much independence they will regain."

Since the Kennedy regime's installation there has been discussion of an amendment to the Federal Reserve Act, making the term of the Chairman co-incident with that of the President. A.H.C.

"PROGRESSIVE WIDENING" (Vol. 2, para. 2) on subordination by the Accepting House Committee - "...in an official request remains in force for so long it may have an effect entirely different from that which the authorities intended. An example (is) the requests... made to the banking community to restrict advances... to his purchase of shares... (which) have now had the effect of stimulating such companies to invite direct deposits of the public."

"...the public" (Vol. 2, para. 2) on subordination by the banks should... often have been facilities within responsible limits... in a running overdraft for creditworthy industrial and commercial customers."

"BANK OF CANADA REPORT, 1966", Page 23: - "The job of a Central Bank is to manage the money supply in such manner as to contribute both to economic growth and to stability of prices. It can make the central bank, and use its influence, but it cannot ensure the total achievement of either objective."

Page 104, containing the following exact Treasury attempt to control "budget" bond prices: "...a final move in a Treasury attempt to influence the will of the Federal Reserve. It would not be a vote... the Federal Reserve would no longer have a voice in deciding monetary and credit policies. It would lose the independent status Congress meant it to have, and, in the most important function of open market operations, it would be reduced to the level of a Treasury creature."

The "Fed" regained its freedom in 1953... ANNO.

"MONTREAL", Page 66: - "In summary then, the Bank of Canada entered the 1950s with a long history of successful open market operations. An government securities. This, however, was based solely on experience during periods when it had not been necessary to use such operations to implement a restrictive monetary policy. The bond market was well developed, partly as a result of the Bank's own efforts, but the Bank's... position in this respect restricted the freedom of action."

"BANK OF CANADA REPORT, 1966", Page 34: - "...the Canada Government loan of 1958 made possible a return (transfer to non-bank) financing of government bond issues and a helping after early October of the monetary expansion which had been necessary to that time." Page 34: - "The reform of the structure of the government debt, and the contribution it made to improving conditions for the sale of Treasury issues... to non bank investors, were important elements in the policy in the present sense and an essential anti-inflationary environment."

the freedom, impinges on credit regulation and control.... the responsibility of the Federal Reserve. Thus the possibility of dispute between two key Federal agencies arises.... the degree of independence.... For one central bank is one of the least independent. Again, the way in which a large debt is managed affects the supply of money.... and the value of money.... Since under the Constitution, the regulation of the value of money is one of the powers given the Congress, new problems.... emerge."

"FEDERAL DEBT", para. 168 - "Optimal.... will differ as to which issues involved in debt management is of the most consequence. In the author's mind the basic question is the future of the quasi-regulated market that in the United States has commonly been described as the free market process.... is a politically controlled money market compatible with the free market process? Or.... what kind of monetary controls are practical if an economy is not to lose the free market character?.... How much distortion in administering a price should a government administer in money? How far, and for how long, can it force a price against the will of the market without creating.... the emergence of a black market?.... at what costs in order to achieve the results desired? To what extent should the government be permitted to employ.... a non-economic measure, to achieve economic goals?.... And it be permitted to use compulsion with the limits would be better and socially more necessary than.... in the hands of the market?.... from the outset been in the hands of the market?.... will certainly start the investment funds of compulsion and institutions upon which many debt management procedures in the past have been based."

This is relevant to the Government loan, the present situation and the 1931 "Optimal Policy" of the Federal Reserve System.

Paragraph 484

"MONETARY REPORT", para. 250. "Throughout the post-war period, the dominant motive of the authorities.... has been the desire to 'tighten' the money life of the economy.... The country.... has its roots in earlier ideas about debt management.... desired to remove the Treasury from monetary claims.... in recent years.... the obvious relevance of the structure of the law to the abnormal liquidity of the economy.... led to more explicit emphasis on funding as 'an aid to monetary control'.... The authorities have had to take a view of the payment of the market in attempts to exploit the deliberate manipulation of terms, the possibilities of market devices, unwillingness to take the risk of market manipulation has ruled out anything that might be labelled 'tightening'...."

"FEDERAL DEBT", para. 170 - "... this is an argument that, in long run, even the Treasury can dispense only as the result of the needs of the market and the wishes of the customer. For if these needs were not met, in some fashion moderately satisfactory

FOOTNOTES TO:

Paragraph #84 (continued) to those who buy and keep government securities, the natural wish of debt owners to liquidate their holdings will create very serious problems.

There is another reason also for respecting...the wishes and requirements of the market. Funds for debt ownership can be allocated in only two ways, voluntarily and compulsorily. If sufficient funds are not allocated voluntarily, fiscal authority must resort to compulsion. That is its last recourse. And if its policies have departed too far and too long from the wishes of the market and the needs of the actual or potential buyers, it is in the position of having itself created the conditions that require compulsion. Unwillingness...to make its obligations competitively attractive...notwithstanding...the number and character of these alternatives, leads ultimately to the use of force--the final mandate of the state...."

Published in 1953, these observations were pertinent to the Conversion Loan, and the situation today. The underlining is mine. A.H.C.

Paragraph #90 "RADCLIFFE EVIDENCE" (Vol. 2, para. 42, of brief by Issuing Houses):- "Also, at or near budget time the market is usually not receptive to new issues...."

Paragraph #93 "U.S. DEALER MARKET" figures for 1948-58 show that issues under one-year in term constituted from 71% to 84.6% of total trading, while those of over five-years in term ranged from 4.9% to 15.9%. To show the trend in long term trading, these averaged 15.6% in the first two years, 1948-9, and but 7.5% for the two latest years 1957-58. (Page 65)

Paragraph #103 "RADCLIFFE EVIDENCE" (Vol. 2, brief by Committee of Scottish Bank General Managers, para. 36 iii):- "Confidence in the gilt-edged market has declined to the point at which the banks are obliged to rely mainly on maturities rather than on sales of investments for the replenishment of their liquid assets."

Paragraph #104 "BANK OF CANADA REPORT, 1956", Page 32:- "Loans by governments to favored borrowers financed from other sources would insulate such favored borrowers from competition in the loan market, but would render more intense the competition among the rest for the remaining (smaller) supply of loanable funds, and interest rates--including interest rates on government securities--would rise still more."

"Page 36" - "In discussions with the chartered banks we have also spoken of the desirability of...making insured mortgage loans under the National Housing Act".

Since 1956, housing interest rates advanced above the legal 6% ceiling applicable on Bank Loans, and Ottawa has become a large direct lender on mortgage loans, thereby adding to the government's borrowings. The availability of 6 3/4% and 6 1/2% NHA Loans, Government guaranteed, provides some competition with long term Government bonds for institutional and other funds. A.H.C.

Paragraph #105 "RADCLIFFE EVIDENCE" (Vol. 2, brief by Council of Stock Exchange, paras. as follows:-

15. Official operations by the authorities...take two main forms:-
 - a. Selling stock off the Departments' portfolios....recently issued and still held by them.
 - b. Purchase of the next maturity against sales of other stocks....
16. These operations and the manner in which they are conducted have become the predominant technical factor affecting the behavior of the gilt-edged market...it would be a rare issue which was not available from official sources the

FOOTNOTES TO:

Paragraph #105
(continued)

moment dealings began....

18. On a falling market official sales can, unless very delicately handled, produce a very unstable market and destroy the normal conditions created by supply and demand with the resulting loss of investors' confidence in gilt-edged stocks....
19. These open market operations....create a pattern of market conditions...closely scrutinized by....investors. Their interpretation of this pattern, which is created by the government's monetary policy has become....important....in deciding....investment policy.
26. It is asked how new types of investors can be attracted. The need is rather to create conditions which will bring back the old....."

Paragraph #112

"FEDERAL DEBT", Page 151:- "If the....Reserve System....continues to be..."stabilizer", both for the economy as a whole....and for the government securities market....then the Reserve Banks' portfolios will....be more or less shaped by the action of other classes of debt holders. This is, the Reserve System, as the residual purchaser, will (have)....the size and makeup of its holdings directly affected by the purchases and sales of other classes of owners....its purchases and sales will in turn be influenced by the general fiscal and financial policies of the government...."

The dis-investment by the general public, and any special deals done with banks, determined the Bank of Canada portfolio trend, willy-nilly, once they "pegged" the market in mid-1958. AHC

Paragraph #117

"McLAURY", Page 294:- "...the pivotal role of the central bank in all phases of the government securities market probably diminished the predictive usefulness of changes in the prices of these securities; on occasion the bank may well have experienced difficulty in distinguishing between the effects of its own operations (and induced reactions to these operations) and the effects of non-official forces of supply and demand in the market. In fact, one of the strongest arguments advanced by proponents of a "bills only" policy is that open market operations conducted in short term securities minimize the chances of a central bank leading itself astray."

Page 305:- "...we might explore briefly the feasibility and desirability of operations in "bills only". With respect to feasibility there does not seem to be any particular reason why the Bank could not limit its operations to purchases and sales entirely in bills (if we exclude debt management responsibilities). Suppose for example that the Bank wanted to offset a rise of 10% in reserves caused by, say, an inflow of foreign capital. In dollar terms this would work out to between \$80 and \$100 million. With the exception of the depletion of its bill holdings which occurred in connection with the Conversion Loan, the bank has maintained a portfolio since 1955 ranging roughly between \$300 and \$500 million. Nor is there reason to think that the market could not absorb sales of this magnitude....In the more likely cases in which the demand for bank credit were expanding, there is still reason to believe that the non-bank public could absorb an increase of this size without undue congestion in the market. During 1959 for example, the non-bank public added nearly \$350 millions to its holdings of Treasury bills...It would appear...that from a strictly technical point of view, the Bank of Canada could probably maintain control of the money supply without recourse to operations in securities other than bills...."

moment dealing began.....

- 18. On a falling market, official sales and interest will be actively handled, produce a very unstable market and they try the normal conditions created by supply and demand with the resulting loss of investors' confidence in gilt-edged stocks.....
- 19. These open market operations..... create a pattern of market conditions..... which is named by..... investors. These operations of this pattern, which is named by the government's monetary policy has become..... important.....
- 20. It is asked how new types of investors can be attracted. The need is felt to create conditions which will bring back.....

to be "...stabilized", both for the economy as a whole..... and for the government securities market..... then the Reserve Bank's portfolios will..... be more or less shaped by the nature of other classes of debt holders. This is, the Reserve System, as the Reserve Bank, will have..... the size and nature of the holdings directly affected by the purchase and sale of other classes of owners..... the purchase and sale will in turn be influenced by the general financial and financial policies of the government....."

The dis-investment by the general public, and any special deals done with banks, determined the Bank of Canada's monetary policy. The market in mid-1982, was "wildly-nifty", once they "popped", the market in mid-1982, was

"HOLDERS", Page 394: - "...the pivotal role of the central bank in all phases of the government securities market program. It limited the production mechanism of changes in the portfolio of securities; on occasion the bank may well have experienced difficulty in distinguishing between the effects of the own operations (and induced reactions to those operations) and the effects of non-official sources of supply and demand in the market. In fact, one of the strongest arguments in favour of programmatic or a "billion only" policy is that open market operations conducted in short term securities maintain the market's central bank leading itself away."

Page 395: - "...we might explore briefly the feasibility and desirability of operations in "billion only". With a market in government securities there does not seem to be any obvious reason why the Bank could not limit its operations to government securities exclusively in bills. If we exclude the management responsibilities, suppose for example that the bank wanted to operate in bills. In reserve raised by, say, an inflow of foreign currency, or a selling of bills, this would not lead to a loss of the bank's reserves. With the exception of the debenture of the bank, the bank has occurred in connection with the conversion of the bank's debenture into a portfolio since 1982. The bank's debenture was raised and \$500 million. It is there reason to think that the bank would not absorb some of this magnitude. The bank's debenture is issued in which the bank's debenture was extended, and it still remains to believe that the bank's debenture would be an increase of this size without any suggestion in the bank's. During 1982, for example, the bank's debenture was raised \$100 million to the holders of Treasury bills. The bank's debenture was then a critical financial point of view, the bank of Canada could probably establish control of the market, and the bank's resources to operations in government securities would be limited."

Paragraph #119 "SIR ROY HARROD", 'Policy Against Inflation' (MacMillan, 1958), displays some fears of what would happen to the gilt-edged market if the "Departments" were ever operated solely in the interests of the beneficiaries. I can see a parallel in the administration of Unemployment Insurance and other Canada government Trusts...AHC.

Pages 237-8:- "I may note....that I see a danger....which might, however, take us by surprise and overwhelm us. This is from the purists. Some voices have already been raised that the Departments should invest their funds in the way most advantageous, from the point of view of yield and liquidity, to the interests for which the funds are held. From the point of view of the purists, this claim is unanswerable; that is why it is so dangerous. We have to run our economy subject to all sorts of limitations and handicaps...our position is already prejudiced...by past history. One of our greatest assets is....the Departments' funds, which give us a degree of freedom in the wise management of the monetary system that any other country might envy. Do not let us lose this freedom for the sake of a merely abstract piece of logic. Let us hold it and keep it and cherish it."

Should Trustees who thus plead, be continued in control of Trust Funds?...AHC.

Paragraph #122 "RADCLIFFE REPORT", Para 68:- "...Since the War the Treasury has had....a.....succession of debt maturities and the necessity of financing....the nationalized industries and local authorities....in a gilt edged market that for many years was gradually realizing that inflation was eroding all fixed money values. The chronically weak market has...been resistant to substantial sales....at any prices...."

Para 490:- "...The authorities can raise interest rates without difficulty since the Bank of England...can name its own price for every maturity in which it chooses to trade. It can safely sell more....government paper, at the longer end of the market...until people become persuaded that the rate of interest is going to be higher than it used to be. But when it wants to reverse the operation it has to be prepared to pour out cash in exchange for bonds...and this glut of liquidity is likely to be a great embarrassment in the future when a change in the economic climate makes restraint and high rates appropriate once more. This consequence would be more pronounced the more artificial the operation appeared to be. There is no doubt that....deliberate manipulation of long interest rates...would be distrusted as artificial juggling with markets...."

Para 544:- "...Since the War the nature of demand for debt has changed, while the authorities have not been prepared...to press for the minimum cost of debt service, but have attached high importance to increasing the average life of the outstanding securities...."

Para 562:- "...The debt manager's task looks straightforward enough, once he is over that awkward preliminary, the diagnosis of economic trends. He has only to lower interest rates.....or to raise them and make it less liquid by selling more long bonds...."

"RADCLIFFE REPORT" Para. 563. "...Witnesses from the Bank of England and the Treasury strongly contested this view of the demand for securities....because....the market in long term securities is dominated by expectations of future prices and is therefore seriously liable to react perversely to a movement of prices...."

"SIR ROY HARRISON", "Policy Against Inflation" (London, 1956).
displays some items of what would happen to the gilt-edged
market if the "Department" were ever operated solely in the
interests of the public. I can see a parallel in the
administration of Unemployment Insurance and other Canada
Government Trusts. . . .

Pages 237-8: "I may note . . . that I see a danger . . . which might
however, take us by surprise and overwhelm us. This is from the
point of view of yield and liquidity, to the interest
points. Some voices have already been raised that the De-
partment should have its funds in the way most advantageous
from the point of view of yield and liquidity, to the interest
for which the funds are held. From the point of view of the
De-
partment, this claim is unwarranted. It is why it is so
dangerous. We have to run our economy subject to all sorts of
limitations and handicaps. . . . Our position is already prejudiced
by past history. One of our greatest assets is the De-
partment's funds, which give us a degree of freedom in the way
management of the monetary system that any other country might
envy. Do not let us lose this freedom in the name of a merely
abstract phrase of logic. Let us hold it and keep it and
cherish it."

Should Trustees who thus plead, be continued in control of
the Trusts?

"RADCLIFFE REPORT", Page 28: " . . . Since the War the Treasury
has had the nationalised industries and local
authorities in a gilt-edged market that for many years was
generally healthy but that was now being steadily
eroded. The Chancellor was worried but, being wedded to
his policy, he said: 'At any price. . . .'"

Page 490: " . . . The authorities can take interest rates
without difficulty since the Bank of England can
own money for every currency in which it chooses to trade. It
can always sell more Government paper, at the longer end of
the market, until it becomes impossible to sell more. But when it
interest is going to be higher than it has to be, then it
wants to reverse the operation it has to be prepared to pay
out cash in exchange for bonds and this kind of liquidity is
likely to be a great disadvantage in the future when a change
in the economic climate makes borrowing and high rates of interest
more onerous. This consequence would be more pronounced the
more artificial the operation appeared to be. There is no doubt
that deliberate restriction of long interest rates
be dismissed as artificial meddling with markets."

Page 544: " . . . Since the War the nature of demand for debt has
changed, while the authorities have not been prepared to
for the minimum cost of debt service, but have extended high
importance to increasing the volume of the outstanding

Page 562: " . . . The debt manager's task looks straightforward
enough, once he is over that awkward preliminary stage of
to economic trouble. He has only to lower interest rates
to raise them and make it less likely by selling more bonds."

"RADCLIFFE REPORT", Page 562: " The Treasury and the Bank of
England and the Treasury strongly contrast this view of
demand for securities The demand in long term
securities is dominated by expectations of future prices and
therefore seriously liable to react adversely to a move
on prices."

Paragraph #122
(continued)

Para. 565. "....A more substantial fear is that a drop in bond prices, especially if it appears to be the result of deliberate action, may be repeated; to the extent that this happens, a rise in interest rates will....reduce the demand for bonds.....as the Governor of the Bank said...."there is always a price at which buyers will appear. That is doubtless true, but the price might be a long way down, much damage might be done on the way...."The evidence we have heard from financial institutions supports the Governor's judgment....he was judging markets as they have functioned in this decade....conditioned by the circumstances of the times and one of these circumstances has been a lack of contact between the minds of the authorities and the minds of outside operators and commentators."

PARAGRAPH #136

"RADCLIFFE EVIDENCE" (vol. 2, paras. 17 & 18 of submission by British Insurance Association:- "....Because of their large resources they are desirable underwriters and their ability to retain heavy allotments.....where an issue is poorly subscribed imparts a measure of stability to the new capital market...As regards underwriting it appears that insurance companies usually underwrite about 50% of a new public issue...."

Though these figures refer to non-U.K. government issues, the amounts involved exceed £110 millions per annum. Could insurance companies help underwrite Canada issues, if they were available at a net price, thus producing a diversity of underwriting as against the system of Bank of Canada holding large blocks of new issues temporarily? A.H.C.

Paragraph #136

"RADCLIFFE REPORT", para. 580 "....we find the customary announcements of full subscription unacceptable. No one supposes that they mean anything more than that the....Bank has taken up the unissued balance....On balance, we recommend that the maximum amount of issue be announced in the prospectus... and that the closing of the lists should be followed by an accurate statement of sales outside "the Departments".

Paragraph #142

"RADCLIFFE EVIDENCE" (Vol. 2, para. 39, of submission by British Insurance Association) contains reference to the British practice of writing down both security portfolios and required policy reserves when there is a substantial rise in interest rates. This has the effect of eliminating the "book value" or "original or amortized cost" concepts which eliminate many trading opportunities in Canada. A.H.C.

Paragraph #144

"LORD NORMAN", Sir Henry Clay, 1957, Page 436 (With reference to the 1931-39 exchange policy in England):- "They (The Chancellor and the Governor) learned empirically the lesson that a country with a weak and uncertain external position cannot commit itself to a fixed rate of exchange, because a fluctuating rate is the only safeguard (except Exchange Control) against undue depletion of its currency reserves: and the corollary that with a floating rate, control of domestic credit conditions must be even stricter than it is when the danger signal of a weak exchange automatically compels credit restriction."

Paragraph #145

"LORD NORMAN", Sir Henry Clay, 1957, Pages 459-60:- "The Governor did not regard the suspension of the Gold Standard as a reason for relaxing the control....over domestic credit... he was alarmed by the increased scope given to political exigencies by the increased influence in the money market of the treasury. He felt the loss of the compulsion exercised by an adverse movement of the exchanges on the Gold Standard.... A floating exchange rate, if a convenience, was also an added danger: when there was any pressure on the country's external payments, a fall in the rate might increase the alarms which caused the flight from Sterling which the lowering of the rate was designed to check...."

para. 265. "A more substantial fact is that a drop in bond prices, especially if it appears to be the result of deliberate action, may be regarded as the extent that this happens, a rise in interest rates will... reduce the demand for bonds.... As the Governor of the Bank said.... "there is always a price at which buyers will appear. There is doubtless time, but the price might be a long way down, much damage might be done on the way...." The evidence we have heard from financial institutions supports the Governor's judgment.... he was judging markets as they have functioned in past decades.... conditions by the circumstances of the times and one of these circumstances has been a lack of contact between the kind of the authorities."

"RADCLIFFE EVIDENCE" (vol. 2, para. 14 & 15 of submission by British Insurance Association) - "...Because of their large resources they are realistic negotiators and their ability to retain heavy allocations.... where an issue is poorly subscribed imparts a measure of stability to the new capital market. As regards underwriting it appears that insurance companies normally underwrite about 60% of a new public issue...."

Through these figures refer to non-U.K. government issues, the amounts involved exceed \$10 million per annum. Could insurance companies help underwrite Canada issues, if they were available at a net price, this producing a diversity of holders, varying as against the spread of bank of Canada holding large blocks of new issues temporarily. A.R.C.

"RADCLIFFE REPORT", para. 200.... "We find it extraordinary announcements of full subscription was reported. No one suggests that they mean anything more than that the... bank has taken up the full amount.... In finance, we recognize that the maximum amount of issues be announced in the prospectus... and that the closing of the issue should be followed by an accurate statement of sales outside the requirements."

"RADCLIFFE EVIDENCE" (vol. 2, para. 30, of submission by British Insurance Association) contains reference to the British practice of writing down both security portfolios and retained policy reserves when there is a substantial rise in interest rates. This has the effect of eliminating the "book value" of "original or amortized cost" concepts which otherwise many trading opportunities in Canada. A.R.C.

to the 1951-52 exchange policy in England) - "While the Chancellor and the Governor (I intend especially by the word) now a country with a weak and unbalanced external position could commit itself to a fixed rate of exchange, because a fluctuating rate is the only original foreign exchange (Governing) against the fluctuation of its currency reserves; and the country which is a leading nation in the world, it is difficult to imagine any other country which is in a position to do so. The danger of not doing so is a serious one."

"The Governor did not regard the situation of the rate of exchange as a reason for relaxing the controls.... over domestic credit... as was also by the Governor's own view on political considerations in the proposed reduction in the money market of the treasury. He felt the loss of the government's credit as an adverse element of the expansion in the rate of interest. A floating exchange rate is a weakness - on the contrary it is a strength, when there was any question of the country's external payments, a fall in the rate of exchange would be a disadvantage, as the light from which the lowering of the rate was designed to emerge...."

FOOTNOTES TO:

Paragraph #145
(Continued)

"GOLD AND THE DOLLAR CRISIS", Robert Triffin, Yale, 1960. Page 45. "most of the major countries would aim at maintaining a reserve level of not less than 40% in most years, feel impelled to adopt severe readjustment measures if this level fell below, let us say, 30% or 33% (of gross imports), and consider themselves forced to adopt drastic measures of control in the face of any persistent or substantial contraction below that critical range".....

Doctor Triffin's figures show Canada's percentage of reserves to gross imports as 55% in 1950, 43% in 1954, and 29% in 1957. Though our merchandise imports may be a little larger than in 1957, our non-merchandise out-payments, on a net basis, may be several hundred millions larger for 1961, while our exchange reserves are no larger, and our total foreign debts a good deal more. If you accept the jargon that a permanent foreign investment here is an "international debt", the increase since 1957 may be in the order of \$7 billions.

Mr. A. T. Lambert, now President of the Toronto Dominion Bank, suggested back on June 17, 1960, that we should have increased these reserves some years back "in order to give us greater independence in our internal policies". A.H.C.

"GRAHAM TOWERS", Toronto, January 25, 1962, at Canada Life meeting:- "Any other country which attempted to run an international current account deficit of the size we have experienced in recent years relative to our national income, would long ago have had to devalue its currency, impose stringent import restrictions, curtail its domestic activities, or a combination of all three policies. The current examples around the world are too numerous to mention. Only Canada has been readily able to borrow from other countries on a scale required to offset the large deficits."...."What is to be desired is a distinct tapering off in our reliance on others before we come to the point where our credit standing is impaired."

The Honourable Dana Porter,
Chairman, and Members
The Royal Commission on Banking & Finance,
Ottawa.

Gentlemen: A Brief by Frank O'Hearn
(14 p - 7 sets)

I respectfully beg to make the following Submission for your consideration:

According to our National Charter, the issue of money in Canada and the control of credit rests exclusively with Parliament.

In actual practice however, Parliament has through the various Acts dealing with banking, money and credit, turned its Right to issue money and control credit over to the Bank of Canada and the Chartered Banks.

Parliament did this moreover, without demanding or getting credit from the banks for the new money issued on its behalf. Unfortunately, the methods employed by the banks didn't provide for payment to Parliament of the monetary credits to which it is entitled.

Accordingly, the people of Canada have inadvertently been cheated out of billions of dollars, and it's now clearly up to Parliament to get the credits from the banks to which it is still entitled, so as to recoup our losses and comply with the terms of our National Charter.

The need for this extra money is indicated by widespread involuntary unemployment, huge unpaid public and private debt, inflated living costs and inflated production costs, and by the continuing shortage of our available capital supply etc.

I submit that a huge shortage in our available money supply is clearly indicated by examination of the government's financial statements, and the combined statements of the banks, and these I am prepared to submit in detail for your consideration if you so desire. For the purposes of this Submission, I submit that the need for a vast improvement in our taxing, banking and monetary procedures is clearly indicated by the following facts, viz.:

According to government figures, our gross national revenue is presently running at a rate of about \$36 billions per year. For a population of 18 millions, this is equivalent to \$2,000. per capita per annum.

Our money supply however, as indicated by the amount of our bank deposits and pocket money, is equivalent to only \$1,000. per capita, a total of only \$18 billions.

From these facts, it's obvious that half of our year's revenue has vanished. In other words, our national money supply is short a total of \$18 billions, equivalent to \$1,000. for each man, woman and child in the country.

It is the loss of this revenue money that has caused our present financial and economic problems, and I submit that the recovery of this money is the first and foremost task confronting your Commission and the government and people of Canada.

So as to recover this huge amount of money, I've developed THE FRANK O'HEARN FORMULA to improve current, taxing, banking and monetary procedures, in which I offer to the government and people of Canada the choice of several practical and feasible methods, as follows;

- 1 - A new method to encash taxpayers cheques;
- 2 - A new method to encash bond collections;
- 3 - A new tax plan;
- 4 - A costless checking method.
- 5 - A costless method to repay bank loans.

I beg to submit details of these alternative methods in EXHIBIT NO. 1 attached.

The many benefits which would accrue to the government and people through the use of this Formula are too obvious to need recounting here in detail. The replacement of the revenue deposits cancelled by the government and banks, and the use of these increased banking resources as a permanent monetary fund, would place the government and people in a sound and solvent condition. The proper recording and balancing of our public and private accounts would remove the fear of further depressions or inflations, and would avert further undue fluctuations in the domestic value of our money. It would end involuntary unemployment and discriminations, and would provide markets freed of restrictions and undue competition. The tax reductions it would make possible would reduce our production and living costs and prices to our common benefit.

The attached Exhibit No. 1 deals with our domestic economy only and doesn't touch on the problems of international trade and settlements. In this area of International Exchange, I beg to submit O'HEARN'S COPYRIGHTED FORMULA FOR INTERNATIONAL MONEY, which I've developed to provide a sound international dollar for world trade and settlements in place of existing methods and media. The details of this proposed international money Formula are contained in the attached EXHIBIT NO. 2, which I submit for your consideration.

This Submission sets forth the fundamentals of the Formulae I've developed to improve our current taxing, banking and monetary procedures and to provide ourselves with an international dollar for our foreign trade and settlements. My Formulae is intended to bring about an era of peace, prosperity and security and so escape further disasters from our financial follies. Everybody will benefit, and nobody will lose if this Formulae is endorsed by the Commission and implemented by the government in the public interest.

This Brief is submitted by

FRANK O'HEARN

October 24th, 1961

Director

The Office of Valuation and Exchange

59 Bethune Blvd.,
Scarboro, Ont.

(A private Research Institute)

P.S. - If this Commission decides to recommend the use of this Formulae by the government in whole or in part, or if the government decides to use it for the benefit of itself and the people of Canada, such use should of course, be on an attributable basis, because of its great potential value and because of the great cost to me of its development.

Frank O'Hearn

P.P.S. - I seek a personal hearing before the Commission to support my Brief if its validity is questioned.

Frank O'Hearn

It is the loss of this revenue money that has caused our present financial and economic problems, and I submit that the recovery of this money is the first and foremost task confronting your Commission and the government and people of Canada.

So as to recover this huge amount of money, I've developed THE FRANK O'HEARN FORMULA to improve current, taxing, banking and monetary procedures, in which I offer to the government and people of Canada the choice of several practical and feasible methods, as follows:

- 1 - A new method to encash taxpayers cheques;
- 2 - A new method to encash bond collections;
- 3 - A new tax plan;
- 4 - A wireless checking method;
- 5 - A wireless method to repay bank loans.

I set to submit details of these alternative methods in EXHIBIT NO. 1 attached.

The many benefits which would accrue to the government and people through the use of this formula are too obvious to need recounting here in detail. The principal of the revenue deposits cancelled by the government and banks, and the principal of these increased banking resources as a permanent monetary fund, would place the government and people in a sound and solvent condition. The proper recording and balancing of our public and private accounts would remove the fear of further depressions or inflation, and would avert further undue fluctuations in the domestic value of our money. It would end involuntary unemployment and distress, and would provide markets freed of restrictions and undue competition. The tax reduction it would make possible would reduce our production and living costs and prices to our common benefit.

The attached Exhibit No. 1 deals with our domestic economy only and dwells much on the problems of international trade and settlement. In this case or International Exchange, I beg to submit O'HEARN'S COMPLETED FORMULA FOR INTERNATIONAL MONETARY, which I've developed to provide a sound international dollar for world trade and settlement in place of existing methods and media. The details of this proposed international money formula are contained in the attached EXHIBIT NO. 2, which I submit for your consideration.

This Submission sets forth the fundamentals of the formula I've developed to improve our current taxing, banking and monetary procedures and to provide ourselves with an international dollar for our foreign trade and settlement. My formula is intended to bring about an era of peace, prosperity and security and to secure further disaster from our financial ills. For nobody will benefit and nobody will lose if this formula is endorsed by the Commission and implemented by the government in the public interest.

This I feel is submitted by

(A Private Research Institute)
The Office of Valuation and Research

59 Balfour Street

P.S. - If this Commission decides to recommend the use of this formula by the government in whole or in part, or if the government decides to use it for the benefit of itself and the people of Canada, such use should of course, be on an equitable basis, because of the great potential value and because of the great cost to me of its development.

P.P.S. - I took a personal hearing before the Commission to support my Brief R.1a. Frank O'Hearn

EXHIBIT NO. 1

COPYRIGHTED FORMULA

by

Frank O'Hearn

The purpose of this Release is to re-state and clarify the Formula I've developed over the years to improve the prevailing taxing, banking and monetary procedure, in the following manner, viz.;

A NEW METHOD TO ENCASH TAXPAYERS CHEQUES:

If this method were to be used by the government of the day in order to get its money's worth, all it would have to do would be to issue instructions to the tax Collector that he must until further notice charge the government's bankers for the full amounts they get from the taxpayers banks to cover the tax cheques. To do this, he would have to charge them with double the face value of the tax deposits. This means in other words, that all tax collections would henceforth be collected from the taxpayers banks in addition to the amounts collected from the government's bankers for deposit of the tax revenues. This is necessary so as to make up the shortage caused by the government's mis-use of public funds to cover its own cheque payments twice over.

This extra tax collection from the banks is essential so as to ensure that the taxpayers cheques are properly paid and encashed. It is also essential to do this so as to avert the cancellation of the taxpayers money and to avoid a shortage in the government's own bank accounts, which follows the use of the present methods.

The collection of these extra amounts would double the receipts from the taxation, and it should be carried out until the accumulated deficit shown in the government's financial reports is completely wiped out. To put it another way, the collection of the extra amounts should be carried out until the deposit assets of the banks are at least equivalent to the amount of investment and loan assets they now hold.

Fortunately, the payment of these extra amounts to the government won't cost the banks anything inasmuch as they already have collected in more than enough to permit them to cover their customers tax payments in full, instead of covering them for only half their cost value, as they now do, and cancelling the unpaid balance.

The collection of this extra money is necessary as I find that when the government deposited its revenue collections, it failed to get its money's worth from its bankers in return. As a matter of fact, it got only fifty cent's worth from them in return for each dollar it deposited.

This is because the money the government deposited actually cost twice as much to get out of the banks in the first instance, as its face value indicated. This is so because twice the amount of cash assets that was actually needed, was foolishly used to cover payment of the revenue cheques and other funds deposited by the government. The face value of the cheques deposited was covered from out of the taxpayers cash account, and from the cash holdings of their bankers too.

Because the government didn't get its money for its face value, it should have charged its bankers with double the face value of its revenue deposits so as to get its money's worth from them in return.

Because of its faulty method of handling its money and of recording its accounts and transactions, the government has already cheated itself and its taxpayers out of \$18 billions.

In view of the foregoing, the first duty of the government is to collect in the balance from its bankers needed to adjust the revenue deposits it has already made. It obviously should do this before it collects in any further taxes of any kind.

One way to do this is for the government to henceforth encash the tax cheques from the taxpayers banks as well as from its own bankers, or else demand credit from its own bankers for the full amounts tendered to them by the taxpayers banks to cover the tax cheques deposited.

A NEW METHOD TO ENCASH BOND COLLECTIONS:

The foregoing Formula for getting in the full value of the taxpayers cheques could be also used by the government to get in the full value of its bond cheques deposited with the banks. The payments for the government bonds should be encashed directly or indirectly by the purchasers banks as well as by the government's bankers. This would double the government's receipts from the sale of its bonds.

A NEW TAX PLAN:

If this alternative method were to be used by the government of the day to collect in additional capital, all it would have to do would be to levy a special tax on the banks to get in the tax money and bond money coming to it from them to adjust its revenue deposits.

This tax-the-banks proposal is intended to show how simply the government could get in the tax money which it let the banks hold back from it when it deposited its tax collections with them. Collection of the extra money should proceed forthwith inasmuch as the cheque payments have already been charged by the banks against the taxpayers accounts.

This proposed tax would not be a tax on the bank depositors or shareholders. It would be a tax on the banks themselves, and they would have to pay the tax by way of deposits to be set up by them in favor of the government.

The extra credit balances would of course, increase the banking liabilities, but these extra liabilities would be offset by permanent debit balances listed on the asset side of the banking statements as deposit assets. In this way, the true financial condition of the banks would be shown for the first time.

If deemed advisable, the banks could issue drafts or cashiers cheques in favor of the government and this paper, when endorsed and deposited by the government, could be held as collateral by the banks to the proposed debit balances.

In view of the huge amount of tax money the government is entitled to get from the banks, the tax levies to make up the shortage could be made on the instalment plan as the money is required by the government.

In this method like the others proposed, the extra amounts could be paid by the banks without cost to themselves or to the shareholders or depositors. This is because the cost has already been paid in full, and the recovery of the money would be freed of further cost.

This tax-the-banks method could also be used by the government to get back from the banks the amounts they over-charged it in connection with its borrowings and cheque payments, as well as to get back the amounts the banks short-changed it in connection with its revenue deposits.

A COSTLESS CHECKING METHOD:

If this alternative method were to be used by the government of the day to pay its accounts, all it would need do would be to issue its cheques in the usual manner together with instructions to its own bankers that they must honour and take in the government cheques without charging the amounts in the usual manner against the government's bank accounts.

Insofar as the banks are concerned, all they would have to do in this regard when they take in the government's cheques, would be to certify them and hold them as permanent negotiable banking assets against their deposit liabilities, and hold them as assets in place of the money they pay out to take the cheques in from the Payees banks.

In other words, the government could by this costless checking method pay its creditors by way of cheques without any cost to itself whatsoever. The government could legitimately do this until it finally recovered all the money due it by the banks.

A COSTLESS METHOD TO REPAY BANK LOANS:

If this alternative method were to be used by the government of the day in lieu of the foregoing methods, it could repay its bank borrowings without any cost to itself or the public whatsoever. It could do this until the current cash deficit in the national economy is replaced with bankable funds.

The use of this new method would also be a new departure in current banking procedures and could be resorted to if deemed preferable to the other methods outlined in my Formula. In order to demonstrate just how readily this method could be utilized by the government, I actually applied it in connection with my own personal accounts with my bank in the following manner;

Back in 1958 I arranged for my bank to purchase securities to a total of \$11,000. and I deposited a further \$11,000. worth of securities with it as collateral. My bank proposed that it make me a loan for \$11,000. and credit the proceeds to my savings account. Though the purchase of the securities and the loan to me were two different and separate transactions, when I got the bank's statement thereof, I found that it had debited me with a total of \$22,000. and credited me with a total of \$11,000. only. On taking the matter up with them, they stated that this was their usual method of handling and reporting all such transactions. I however, protested that they mis-handled and mis-reported my transactions and that they had either over-charged me or short-changed me in a total of \$11,000. The bank refused to correct the accounts or remedy my protest.

I subsequently had them sell a portion of the securities for \$3,000. which they credited to my savings account and out of which I instructed them to transfer \$2,000. to the credit of my loan account, reducing the latter to \$9,000. In reporting my transactions up to that point, the bank had debited me with \$24,000. and credited me with only \$15,000., making the \$9,000. which prevailed until I recently took the matter into my own hands for settlement.

A COSTLY CHECKING METHOD

If this alternative method were to be used by the government of the day to pay its accounts, all it would need do would be to issue the checks in the usual manner together with instructions to its own banks that they must honor and take in the government checks without charging the amounts in the usual manner against the government's bank accounts.

Indeed, as the banks are concerned, all they would have to do in this regard when they take in the government's checks, would be to credit them and hold them as part of their negotiable banking assets against their deposit liabilities, and send them as assets in place of the money they pay out to take the checks in from the Federal bank.

In other words, the government could by this costless checking method pay its credit by way of checks without any cost to itself whatsoever. The government could legitimately do this until it finally recovered all the money due it by the banks.

If this alternative method were to be used by the government of the day in lieu of the existing methods, it could repay its bank borrowings without cost to itself or the public whatsoever. It could do this until the current cash deficit in the national economy is replaced with bankable funds.

The use of this new method would also be a new way to run the current banking procedures and could be extended to all demand deposits in the other banks included in my Formula. In order to demonstrate just how readily this method could be utilized by the government, I actually applied it in connection with my own personal accounts with my bank in the following manner:

Back in 1958 I arranged for my bank to purchase securities to a total of \$11,000 and I deposited a further \$11,000 worth of securities with a cost total of \$22,000. My bank proposed that it make me a loan for \$11,000, and credit the proceeds to my savings account. Through the courtesy of the bank's manager and the loan terms were very liberal and separate transactions. When I got the bank's statement thereof, I found that it had debited me with a total of \$22,000, and credited me with a total of \$11,000 only. On taking the matter up with them, they stated that this was their usual method of banking and reporting all such transactions. I however, pointed out that they had debited and mis-reported my transactions and that they had often overcharged me in short-changed me a total of \$11,000. The bank refused to correct the accounts or remedy my protest.

I subsequently had them sell a portion of the securities for \$2,000, which they credited to my savings account and out of which I instructed them to transfer \$2,000 to the credit of my loan account, reducing me after to \$9,000. I reported my transactions up to that point, the bank had debited me with \$22,000, and credited me with only \$11,000, making the \$11,000 which proved I really had the money to pay into my own hands for settlement.

1
2
3
4
5 I therefor recently divested my bank of the loan collateral it held for me by
6 having deposits of outside money made in exchange for the collateral and having the
7 proceeds credited to my savings account. This provided me with a deposit balance
8 equivalent to the loan debt it had charged against me.

9 Inasmuch as my bank turned over my collateral to my broker against payment and
10 credited the proceeds to my savings account, I then recognized the debt and notified
11 them of my desire to pay it off in full. I pointed out however, that because of the man-
12 ner they mis-handled my previous repayment, I couldn't pay off the balance in a simi-
13 lar manner.

14 This is because my bank cancelled my \$2,000. of savings money when they got
15 it from me in repayment, in place of turning my money over to Parliament where it
16 undoubtedly belongs. Hence, they improperly cut this amount from our available
17 national money supply. I pointed out also that my Formula is intended to permit the
18 repayment of bank loans without the cancellation of the customers hard-earned money
19 in the usual banking manner.

20 I stressed my desire to keep my savings money in circulation and insisted that
21 after we squared up our contra indebtedness, my money must be with either one of us.
22 Hence, in order to safeguard my savings money and to give effect to my Formula, I
23 then cancelled my indebtedness to my bank and retained the money and applied it as a
24 partial capital return to offset the huge costs of developing my Formula over the past
25 30 years.

26 I also stress the fact that if I were to pay my bank its loan charge in the
27 customary manner, I would be mis-handling my money and mis-reporting my trans-
28 actions, and I would also be cutting \$9,000. from my savings balance and my bank
29 would be cutting \$9,000. from off its loan assets, making the repayment cost \$18,000.
30 to discharge the \$9,000. loan debt. This inflation of repayment costs would cause a
\$9,000. loss in our money supply and would be altogether too costly. I could have no
part in such an improper and illegal procedure.

My action of course, constituted a new departure in the handling of our money and
the recording of our banking transactions, and creates a precedent which could be pro-
perly followed and adopted by the government of the day, or by other banking customers
should the government fail to take advantage of my Formula.

It's clear that by my action, I have averted a loss of \$9,000. in our money supply.
I divested my bank of the loan collateral and stripped it of its evil power to forcibly
close out my accounts and cancel my savings money in the usual banking manner without
turning the capital profit over to Parliament.

So as to give my bank further opportunity to remedy my complaints on its own, I
advised it that I would be quite willing to pay it the loan debt providing it would under-
take to keep my savings money in circulation and report it as an asset, for obviously
the banks should report deposit assets as well as deposit liabilities. I also required
it to report a \$9,000. capital profit and pay whatever taxes the government called for
thereon. Otherwise, I suggested that it abandon its loan charge against me and report
a deposit asset in lieu thereof, or also report a deficit in its deposit assets so as to
show its true financial standing as required by the various laws governing its operations.

I therefore received directly from my bank of the loan collateral it held for me, having deposits of outside money made in exchange for the collateral and having the proceeds credited to my savings account. This provided me with a deposit balance equivalent to the loan debt it had charged against me.

Inasmuch as my bank turned over my collateral to my broker against payment credited to the proceeds to my savings account, I then recognized the debt and realized them of my debt to pay it off in full. I pointed out, however, that because of the manner they mis-handled my previous repayment, I could not pay off the balance in a short time.

This is because my bank recalled my \$7,000. of savings money when they got it from me in repayment in place of turning my money over to Investment where it undoubtedly belongs. Hence, they improperly cut my account from an available national money supply. I pointed out also that my former intention to permit the repayment of bank loans without the cancellation of the customer's hard-earned money in the usual banking manner.

I stressed my desire to keep my savings money in circulation and insisted that after we agreed to our contract (indebtedness), my money must be with either one of us. Hence, in order to safeguard my savings money and to give effect to my formula, I then cancelled my indebtedness to the bank and retained the money and equivalent as a partial option return to offset the huge costs of developing my formula over the past 30 years.

I later stress the fact that if I were to pay my bank the loan change it was customary manner, I would be debt-laden by my money and money owed to the bank, and I would also be owing \$9,000. from my savings balance and my bank would be owing \$9,000. from the loan assets, making the repayment cost \$18,000. to discharge the \$9,000. loan debt. This instant of repayment cost would cause a \$9,000. loss in my money supply and would be altogether costly. I could never part in such an improper and illegal procedure.

My action of course, constituted a new deposit in the hands of the bank and the resulting new banking transactions, and created a precedent which could be properly followed and adopted by the government of the day, or by other banking institutions should the government fail to take advantage of my formula.

It is clear that by my action, I have avoided a loss of \$9,000. in my money supply, I divested myself of the loan collateral and money, and the debt owed to the bank, I closed out my account and cancel my savings money in the new banking manner without running the original profit over to Investment.

So as to give my bank further opportunity to reimburse my formula on the one hand, I said that I would be able to pay off the loan and avoid the debt and make to keep my savings money in circulation and report it as an asset, not a liability. The bank would report deposit assets as well as deposit liabilities. I would report a \$9,000. capital profit and my wife would take the government's share of the profit. (However, I suggested that it should be the loan change against me and report a deposit asset in her name), or also report a capital profit against me and report a deposit asset in her name, as required by the various laws governing the operation of the true financial, according as required by the various laws governing the operation.

Nethercut & Young

Toronto, Ontario

A1091

It is because of the foregoing that I submit that the government of the day may beneficially use this proposed costless method of repaying its bank borrowings without any cost to itself or the public whatsoever, in just the same way that I've done with my bank. In this way, the government may avert such losses in the future, and make capital profits from now on so as to make up for past losses.

I furthermore submit that the government could issue \$18 billions in new government money forthwith and deposit it in the banks in exchange for bank balances, but doing this wouldn't free it from its obligation to collect in the \$18 billions it is entitled to get free of cost from the banks to settle up and properly balance its banking transactions to date. Hence, all that is necessary now is for the government to take advantage of some one or other of the alternative methods I've submitted to remedy the intolerable conditions I've exposed, and to avert similar losses in the future so as to recoup the losses we've suffered from the lack of sufficient money to conduct our business affairs and pay our public and private debts.

P. S. TO EXHIBIT NO. 1

THE FRANK O'HEARN FORMULA

With reference to my charge that half of our past year's revenue deposits has vanished, here's one way of explaining this phenomenon;

Half of the past year's gross revenue deposits were turned over by the depositors to the banks to pay off their borrowings for the year. In this way, the banks got \$18 billions of their customers revenue deposits, and they got this earned revenue in addition to the reduction they also got in their liabilities to depositors resulting from the loan repayments.

Unfortunately however, the banks have so far failed to report the revenue deposits they got from their customers as banking assets, received by them in place of the paid-off loan assets. In this way, the banks under-stated their assets to a combined total of \$18 billions. This is clear, for had they fully reported their deposit assets, their total assets would now be \$18 billions more than they report in their statements, and this in turn would disclose that the true assets of the banks exceed their liabilities to depositors by an equivalent total of \$18 billions.

As stated, the banks don't report this extra banking capital, neither do they report the deficit in their deposit assets, and their statements consequently, don't show their true financial condition, as called for by the various Acts governing their operations.

The validity of the foregoing charge is supported by examination of the financial statements issued by the government and the methods employed by it in its banking transactions. My charges are further supported by examination of the banking statements in relation to the Canadian Economy in general.

It was in order to have our missing revenue deposits replaced and recovered that I developed THE FRANK O'HEARN FORMULA to improve current taxing, banking and monetary procedures, all as submitted in this Brief.

Frank O'Hearn

THE FRANK O'HEARN FORMULA

With reference to my charge that half of our past year's revenue deposits had been taken, here's one way of explaining this phenomenon:

Half of the past year's gross revenue deposits were turned over by the depositor to the banks to pay out their borrowings for the year. In this way, the banks got \$18 billion of their customers' revenue deposits, and that got this earned revenue in addition to the reduction they also got in their liabilities to depositors, resulting from the loan repayments.

Unfortunately, however, the banks have so far failed to report the revenue deposits they got from their customers as banking assets, recorded by them in place of the paid-off loan assets. In this way, the banks under-stated their assets to a considerable extent. This is clear, for had they fully reported their deposit assets, their total assets would now be \$18 billion more than they report in their statements, and this in turn would disclose that the true assets of the banks exceed their liabilities to depositors by an equivalent total of \$18 billion.

As stated, the banks don't report this extra banking capital, neither do they report the deficit in their deposit assets, and their statements consequently don't show their true financial condition, as called for by the various state governments in their operations.

The validity of the foregoing charge is supported by examination of the financial statements issued by the government and the methods employed by it in its banking transactions. My charges are further supported by examination of the banking statements in relation to the Canadian economy in general.

It was in order to have our missing revenue deposits replaced and recovered that I developed THE FRANK O'HEARN FORMULA to improve current taxing, banking and monetary procedures, all as published in this Brief.

EXHIBIT NO. 2.

O'HEARN'S FORMULA FOR INTERNATIONAL MONEY

PURPOSES:

The purpose of this Formula is to make international dollars available for international trade and settlements, in order to facilitate world trade and exchange, and make all forms of wealth available to all peoples at proper domestic prices, as stated in terms of international money.

The proposed new international money for world trade is the logical outcome and development of existing monetary media and procedures now generally in use for business purposes. The proposed new international dollars and new exchange facilities are based on the findings and disclosures made by Mr. Frank O'Hearn, Scarboro, Ontario, Canada, after many years of extensive and expensive investigation of existing financial methods.

No international money has heretofore been available for international trade, so that the proposed new international dollars are an improvement upon and basically different to anything heretofore available to importers and exporters. When this new money is in general use, all payments and settlements of international trade will be made in international dollars, and not in domestic currencies or other media as heretofore. Payments will be made by cheque drawn by the importer against his checking balance carried on the books of the proposed International Money Office. All such cheques would be certified and charged against the Importer's account in the usual banking manner, and the proceeds credited to the Exporter's account, thus keeping the money balances always in balance, and available for spending by the current holders. Thus, it is intended that an International Money Office be authorized to give effect to the proposals of this Formula.

ASSETS:

The assets of the proposed International Money Office, against which its international money balances are to be issued, would consist of a permanent money account plus various domestic currencies. Unlike ordinary commercial banks, no loans or loan collateral would be carried as assets - only international money balances and domestic currencies.

Deposits of domestic currencies would be accepted by the International Money Office in exchange for international checking account balances. Investment in domestic currencies would be made by the issue of international dollar balances in exchange on the proper exchange basis as calculated for exchange rates and valuations.

As domestic currencies are accepted on deposit in exchange for international dollar checking balances, the International Money Office to acquire its additional assets, could issue cashiers certified cheques in favor of the governments making use of its money and facilities for import and export trade. These certified cheques, when endorsed by the governments concerned, could be held as collateral to the proposed permanent money account by the International Money Office. As this would provide entirely new issues of international money, a clear gain would accrue therefrom.

EXHIBIT NO. 21

INTERNATIONAL TRADE AND SETTLEMENTS

The purpose of this formula is to make international dollars available for international trade and settlements, in order to facilitate world trade and exchange, and make all forms of wealth available to all peoples at proper domestic prices, as stated in terms of international money.

The proposed new international money for world trade is the logical outcome and development of existing monetary media and procedures now generally in use for business purposes. The proposed new international dollars and new exchange facilities are based on the findings and disclosures made by Mr. Frank O'Hara, Scarborough, Ontario, Canada, after many years of extensive and expensive investigation of existing financial methods.

No international money has heretofore been available for international trade, so that the proposed new international dollars are an improvement upon and basically different to anything heretofore available to importers and exporters. When the new money is in general use, all payments and settlements of international trade will be made in international dollars, and not in domestic currencies or other media as heretofore. Payments will be made by cheque drawn by the importer against the clearing balance carried on the books of the proposed International Money Office. All such cheques would be certified and charged against the importer's account in the usual banking manner, and the proceeds credited to the Exporter's account, thus keeping the money balance always in balance, and available for spending by the current holders. Thus, it is intended that an International Money Office be authorized to give effect to the proposals of this formula.

ASSETS:

The assets of the proposed International Money Office, against which its international money balances are to be issued, would consist of a permanent money account plus various domestic currencies. (Unlike ordinary commercial banks, no loans or loan collateral would be carried as assets - only international money balances and domestic currencies.)

Deposits of domestic currencies would be accepted by the International Money Office in exchange for international clearing account balances. Investment in domestic currencies would be made by the issue of international dollar balances in exchange on the proper exchange basis as calculated for exchange rates and valuations.

As domestic currencies are accepted on deposit in exchange for

acquire its additional assets, could reserve cashiers certified cheques in favor of the government making use of its money and facilities for import and export trade. These certified cheques, when endorsed by the government, could be held as collateral to the proposed permanent money account by the International Money Office. As this would provide entirely new issues of international money, a clear gain would accrue therefrom.

CAPITAL INCREMENT:

It is intended that the capital gain accruing from the new issues of the International Money Office shall accrue to the governments endorsing its cashiers cheques and the use thereof as collateral to its permanent money account. Thus, by listing this new international money in its cash records and by turning the profits therefrom over to the governments concerned, no debt of any kind would be incurred and no repayments or interest would be called for on the part of the governments reaping the profits. As its money assets are set up, the International Money Office would enter corresponding amounts of international checking balances in the accounts of its customers. The amounts would be entered as these initial cash transactions are effected in international money, less reservations for surplus account, but no additional premiums or discounts would apply. Hence, the governments accepting such proposals would be furnished with an immediate supply of international money available for spending forthwith in international trade.

The amount of bonuses to the participating governments would be calculated on its foreign trade requirements as agreed by the governments and International Money Office, and would bear in general principle, a comparative ratio to the bonuses to other governments to avoid discrimination.

MONEY SUPPLY:

The total supply of international money would be governed by international exchange requirements, and would be controlled by the amount of its own bonus issues plus the amounts put out against investments or deposits in domestic currencies.

DEPOSITS:

As participating governments sell or deposit their own currency at quoted rates with the International Money Office, they would also get their respective amounts of bonus checking balances. No shortage of international money could result from this arrangement. In this manner the International Money Office would be assured that its assets would always be made up of equivalent parts of permanent money balances and domestic currencies. Unrequired holdings of international dollars by any government could be resold at any time to the International Money Office and its own currency regained. Should it be deemed advisable at any time, an issue of international notes or coinage could be made by the International Money Office for payment of withdrawals from customers checking accounts, but transfers of balances by means of cheques would probably suffice.

EVALUATION:

To ensure the value and stability of its assets and of its outstanding international dollars, the national currencies purchased or accepted for deposit by the International Money Office would have to stand up to certain requirements, otherwise the backing and value of its international money would be prejudiced.

and their expressed valuation in terms of international money would be made use of. In brief, this method would be to ascertain the respective domestic values of the various currencies in terms of a group of selected domestic cost items. A weighted index average thereof would be computed to express the current domestic value of such currency as indicated by its own domestic price values. Such indices and arithmetical computations would then be used to arrive at the proper ratios between domestic currencies and international dollars. A numerical index based on a chosen suitable ratio, would be computed to indicate the proper relation of each domestic currency to the basic ratio. The result would be a comparative rate of exchange and currency valuation suitable for use to govern the amount of international money to be issued in exchange for domestic currencies. In this manner the value of the currencies to be held as assets by the International Money Office would be assured, and the values of its outstanding dollar balances stabilized and their proper exchange values indicated.

To further protect the exchange rates and values of its outstanding international money and of its currency assets, certain other requirements would be made on domestic currencies. Governments concerned would be expected to offer evidence that its domestic economy is in a solvent condition, and that sufficient domestic funds are available to its residents for their domestic requirements. No inflations or deflations of its domestic currency could be permitted to upset the worth of the domestic currencies carried as assets by the International Money Office, otherwise, their currencies would not be acceptable as such assets. Certain maximum and minimum limits to the totals of domestic currencies outstanding at any one time, based on domestic requirements, would be mutually agreed upon.

SUMMING UP:

The foregoing outlines the general make up and procedure of the proposed International Money Office and of its new international dollars. The purpose, restated, of making its money and facilities available for international trade is obviously to facilitate world trade and exchange, and to make all forms of wealth available to all peoples at proper domestic prices, stated in terms of this international money. General use of this new international money would obviate direct dealings in domestic currencies between nations. No reserves of any particular currency would have to be built up by any nation. International Money would remove all artificial restrictions to world trade - no further depressions in world trade would occur and all the evil results of such depressions would be removed once and forever.

Issued and evaluated in the foregoing manner, valuable convertible and negotiable international money would be a perfected medium for world trade. Easier sale abroad for domestic products would be permitted and encouraged. The prices of world trade would express its proper comparative values. Countless benefits would accrue to the entire world - the resulting financial freedom would ensure economic freedom to the entire human race. Prosperity and peace would be made possible by the general use of the funds and facilities of the proposed International Money Office. No other plan is feasible.

and their expressed valuation in terms of international money would be made use of. In brief, this method would be to ascertain the respective domestic values of the various currencies in terms of a group of selected domestic cost items. A weighted index average thereof would be computed to arrive at the proper ratios between domestic currencies and international dollars. A numerical index based on a chosen exchange rate would be computed to indicate the proper relation of each domestic currency to the basic ratio. The result would be a comparative rate of exchange and currency valuation suitable for use to govern the amount of international money to be issued in exchange for domestic currencies. In this manner the value of the currencies to be held as assets by the International Money Office would be ascertained, and the values of its outstanding dollar balances established and their proper exchange values indicated.

To further protect the exchange rates and values of its outstanding international money and of its currency assets, certain other requirements would be made on domestic currencies. Governments concerned would be expected to offer evidence that its domestic currency is in a solvent condition, and that sufficient domestic funds are available to it to discharge its domestic currency obligations. Its obligations of domestic currencies carried as assets by the International Money Office, otherwise, their currencies would not be acceptable as such assets. Certain restrictions and minimum limits to the total of domestic currencies outstanding at any one time, based on domestic requirements, would be mutually agreed upon.

SUMMARY

The foregoing outlines the general make up and procedure of the proposed International Money Office and of its new international dollar. The purpose, related, of making its money and facilities available for international trade, is obviously to facilitate world trade and exchange, and to make all forms of wealth available to all peoples at proper domestic prices, stated in terms of this international money. General use of this new international money would operate direct dealings in domestic currencies between nations. No reserves of any particular currency would have to be built up by any nation. International Money would remove all artificial restrictions to world trade - no further negotiations in world trade would occur and all the evil results of such negotiations would be removed once and forever.

Issued and evaluated in the foregoing manner, a variable convertible and negotiable international money would be a perfect medium for world trade. Easier sale abroad for domestic goods would be permitted and encouraged. The prices of world trade goods would be proper comparative values. Countries domestic currencies would become the essential world - the resulting financial freedom would remove economic freedom to the entire human race. Country and people would be made possible by the general use of the funds and facilities of the proposed International Money Office. No other plan is feasible.

As to the financing of the International Money Office itself, this is a comparatively simple matter. Once a government adopts the foregoing proposals and gets its checking account opened, the International Money Office would make a small service charge for handling such account. This service charge would be paid by the government concerned in its own currency. The domestic funds thus received would be spent by the Office on Headquarters expenses and obligations, and for opening, equipping and staffing suitable branch offices in the nations concerned to service their international money accounts.

Each government taking advantage of these proposals and facilities would have the privilege of nominating a member of the Executive or Governing Board of the International Money Office. It would also have the privilege of nominating the Director who would be resident in charge of the branch office in their respective countries.

At the start, the prices to be charged for goods exported would be set by the exporters and would have to be acceptable to the importers to effect a transaction. When the International Money Office operations are in full swing, calculations of the proper exchange rates and values would be made for world trade in accord with the foregoing methods and procedures. These international exchange rates and values and the international dollars would be made available to all nations on the foregoing basis as a sound basis for world trade, exchange and settlements.

Importers and exporters as well as governments would be entitled to take advantage of this perfected international money and facilities to transact world trade; to help prevent repetitions of past depressions; to ensure world prosperity and peace, and as a means of escape from the evils we've all experienced because of the lack of sound international money for world trade.

P.S. TO EXHIBIT NO. 2.

O'HEARN'S FORMULA FOR INTERNATIONAL MONEY

In order to demonstrate how my Formula for international money could be beneficially implemented through existing international agencies, I submitted a proposition to the International Monetary Fund for consideration as follows;

The holdings of the IMF include $\$8\frac{1}{2}$ billions worth of securities payable in Members currencies. While these are demand securities, they are non-negotiable and non-interest bearing, and while they are held by the Fund as assets, they may be considered as frozen capital derived from subscriptions of the member governments.

The proposal I made to the Fund is intended to bring about the release of this frozen capital by freeing it and making it available to the member nations in the form of negotiable checking balances suitable for use as payments for international trade and balances. By releasing this frozen capital for circulation as international money, the operations of the IMF and the World Bank would be re-vamped and brought into line with the requirements of my Formula.

Checking balances would be allotted to the member nations in lieu of and in place of their frozen share capital. The member nations could then use certified payments drawn on their checking accounts, as valuable negotiable international money in full settlements, in lieu of and in place of existing methods and media.

In giving effect to my proposals, the Fund would turn over its $\$8\frac{1}{2}$ billions of uncashed demand obligations to the re-vamped International Bank in exchange for a like amount of negotiable checking balances. The IMF would then have the checking balances as its assets in place of the members demand obligations, and it could then commence making payments by way of cheques immediately.

In addition to the foregoing, the re-vamped International Bank would accept all IMF cheques from the Payees as cash deposits, and could do this free of cost to the Fund, and without making any charges or reductions in its checking balances whatsoever. In this way, the IMF would make a clear capital gain for the full amount of the checking issues accepted by the International Bank as cash deposits from the Payees.

Moreover, as the IMF cheques were received on deposit by the International Bank, the Fund could if so desired, draw back an equivalent amount of its present investment holdings against its own checking balances. In this manner, the IMF could regulate the total amount of checking balances outstanding on the books of the International Bank, over and above the permanent portion outstanding against the permanent deposit assets referred to above.

If these proposals were to be carried out as I've suggested, Canada's share of the resulting capital gain would amount to over \$300 millions.

Toronto, Ontario

1A1098

P.S. TO EXHIBIT NO.2.

Though the IMF officials haven't yet advised me of their decision in regard to my proposals, and though my proposals haven't so far as I know, been yet submitted to the member nations for consideration, I can advise the Commission that the United Nations Secretariat for Economic and Social Affairs wrote me saying that my Formula is conceptually well-founded, and that my proposals represent a valuable contribution to the general progress of ideas, and to a better understanding of the fundamental issues which confront the world economy.

It's obvious that a sound international dollar for our foreign trade and settlements is a must if we Canadians are to have a sound basis for peaceful and prosperous international trade and intercourse.

I therefor hope that the Commission will come to the conclusion and will also recommend that Canada should spearhead a movement in the United Nations to have my proposals submitted to the member nations for consideration, and also recommend that Canada should take the necessary steps to get the world at long last an international dollar suitable for our international trade and settlements, all as set out in Exhibit No.2 hereof.

It's obvious that a sound international dollar for our foreign trade and settlements is a must if we Canadians are to have a sound basis for peaceful and prosperous international trade and intercourse.

and will also recommend that Canada should sponsor a movement in the United Nations to have my proposal submitted to the member nations for consideration, and also recommend that Canada should take the necessary steps to get the world at large to accept an international dollar unit for our international trade and settlements, since set out in Exhibit No. 2, heretofore.

Frank O'Brien

The Honourable Dana Porter,
Chairmen, and Members,
Royal Commission on Banking & Finance.

Gentlemen: SUPPLEMENT TO BRIEF FILED BY FRANK O'HEARN

In connection with the brief I filed with you on October 24th last, I deem it necessary for your information to now submit the following as a Supplement thereto:

In my covering letter, I made the charge that half of our past year's revenue has vanished; that our national money supply is short in the total of \$18 billions, equivalent to a loss of \$1,000. per capita.

I now submit that a major cause of this shortage in our cash resources may properly be laid to the crooked bookkeeping of our banks and government. In support of this serious charge, I submit the following information for your consideration:

RE CROOKED BOOKKEEPING BY OUR BANKS:

My charge in this regard is that the banks took a total of \$18 billions from their customers bank accounts in the past year without compensating them in any way whatsoever. They took this money from the government and other customers bank accounts alike, including my own personal accounts. Moreover, they did so without reporting the money as a banking asset, and without reporting the capital gains which accrued to them from their forcible reduction in their liabilities to customers. They did this too, without paying any taxes whatsoever on their ill-gotten gains.

In order to illustrate just how this was accomplished, and at the same time bring you Commissioners up to date regarding my dispute with my bankers, the Bank of Nova Scotia about my own personal accounts as set forth on page 3 of my Brief, I would advise as follows:

On October 31st last, the date of the annual report and statement of assets and liabilities put out by the Scotia Bank, that bank owed me a total of over \$13,000. all as shown in my pass books, while at that same date, I wasn't indebted to it in any way whatsoever. Our contra accounts were in proper balance at that date.

While the bank's liability to me was included in its financial statement, it improperly included amongst its assets a loan charge and debt against me for \$9,000. despite the fact that I had discharged its alleged debt in September last, and despite the fact that I wasn't indebted to it after that date in any way whatsoever.

Hence, I charge that the Scotia Bank deliberately falsified its financial report and that it should have reported a cash deficit or overdraft in its report instead of mis-reporting that I owed it \$9,000. For a period of 40 days last year my bank accounts were properly reported, and my money supply was properly reported too, for the first time in our history.

Despite these facts, the bank on November 8th last forcibly took \$9,000 from my savings account by way of an invalid debit, despite my protests, and it did so without compensating me for it in any way whatsoever.

This explains just how the Scotia Bank cheated me out of \$9,000. and cut my money supply, and the national money supply too, accordingly. It shows too just how the bank concealed the shortage in its own cash holdings, and how it improperly wrote-off its own deficit at my expense, and extorted \$9,000. from me under false pretenses, and caused me a like deficit in my own personal cash resources. This is the common practice of the banks in connection with their customers borrowings, deposits and loan

The Honourable Dean Fortes,
Chairman, and Members,
Royal Commission on Banking & Finance.

In connection with the point I filed with you on October 24th last, I have
necessity for your information to now submit the following as a Supplement thereto:
In my covering letter, I made the charge that half of our past year's money
supply has vanished, that our national money supply is short in the total of \$18 billion
equivalent to a loss of \$1,000 per capita.

I now submit that a major cause of this shortage in our cash resources
properly be laid in the credited bookkeeping of our banks and government. In addition
of this serious charge, I submit the following information for your consideration:

RE CROOKED BOOKKEEPING

whereas. They took the money from the government and other customers' bank
accounts alike, including my own personal accounts. Moreover, they did so with
regarding the money as a banking asset, and without reporting the capital gains
accrued to them from their forcible reduction in their liabilities to customers. I
did this too, without paying any taxes whatsoever on their ill-gotten gains.

In order to illustrate just how this was accomplished, and at the same time
bring you Commissioners up to date regarding my dispute with my banks, the \$18
of Nova Scotia about my own personal accounts as set forth on page 3 of my first
report is as follows:

On October 31st last, the date of the annual report and statement of assets
and liabilities put out by the Scotia Bank, that bank owed me a total of over \$18,000,
all as shown in my pass books, while at that same date, I wasn't indebted to it in
any way whatsoever. Our entire accounts were in proper balance at that date.

While the bank's liability to me was included in its financial statement,
improperly included amongst its assets a loan charge and debit against me for \$7,
despite the fact that I had discharged its alleged debt in September last, and despite
the fact that I wasn't indebted to it after that date in any way whatsoever.

Hence, I charge that the Scotia Bank deliberately falsified its financial
report and that it should have reported a cash deficit or overplus in its report to
of this regarding that I owed it \$9,000. For a period of 10 years last year my bank
accounts were properly reported, and my money supply was properly reported for
the first time in our history.

Despite these facts, the bank on November 31st last forcibly took \$9,000
my savings account by way of an interest debit. Despite my protest, and it did so
out compensating me for it in any way whatsoever.

This explains just how the Scotia Bank cheated me out of \$9,000, and
money supply, and the national money supply too, accordingly. It shows the bank
bank covered the shortage in its own cash holdings, and how it improperly was
its own deficit at my expense, and amounted \$9,000 from me under false pretenses.
caused me a like deficit in my own personal cash resources. This is the common
vice of the banks in connection with their customers' borrowings, deposits and loans.

1
2
3
4
5 repayments.

6 I advised the Government about this banking fraud and it advised me that I
7 would have to fix up my accounts with the Scotia Bank myself. This leaves it up to me
8 to take legal action against my bankers, which the Commissioners can quite well under-
9 stand, is an almost hopeless task. This is particularly so as the Auditors and Lawyers,
10 the Courts and the Press all seem to be quite determined to perpetuate this intolerable
11 condition and thus prevent me from getting my money and banking profits. Of course,
12 they are all acting against the public interest in this matter and are exposing themselves
13 and everybody else to the evil consequences now menacing us all from our own misdeeds.

14 RE CROOKED BOOKKEEPING BY OUR GOVERNMENT:

15 My charge hereinregard is that the Finance Department grossly misrepresents
16 the true financial condition of the Government of Canada in its published financial state-
17 ments. For instance; its statements report a net debt owing by it of over \$12 billions.
18 It reports that this unsecured debt is made up of an accumulation of annual deficits.

19 My investigations however, shows that the net debt it reports is nothing more
20 or less than a deferrment of taxation which the government has so far failed to levy,
21 but which it may properly levy at any time to enable it to meet its unpaid war debts and
22 other bonded debts. Hence from this viewpoint, the government could correct its reports
23 to show an item on the asset side of its statement for Deferred Taxation amounting to
24 \$12 billions, in place of the net indebtedness now shown by it.

25 From another viewpoint however, my Formula discloses that there is a tan-
26 gible cash asset available to the government which it has so far refused to report or
27 encash. This consists of the amounts owing to it by its bankers to refund the amounts
28 they took from its bank accounts without compensating it in any way whatsoever.

29 The loss of this money and the government's gross mis-reporting of it, is the
30 direct result of its crooked bookkeeping. It makes a practice of mis-crediting its bankers
31 for loan debts which it previously repaid. In brief, the government is continually turning
32 bond money and tax money over to its bankers without getting any compensation whatso-
33 ever from them in return. In this way, the Government is directly responsible for the
34 loss of \$18 billions of the people's hard-earned money, and its failure to safeguard and
35 account for these public funds is concealed from the public by its own crooked bookkeep-
36 ing and falsified financial reports and statements.

37 From this viewpoint therefor, the government should report the \$18 billions
38 owing to it by its bankers, as a cash asset and should collect the money from the banks
39 in the public interest. When the Government does this, its accounts will then show a
40 cash capital surplus of \$6 billions, instead of the cash deficits it now wrongfully reports.
41 This Formula opens up a new source of revenue for the Government, apart from and in
42 addition to taxation and borrowings. With our proper money supply available, the need
43 for bank credit would ease off accordingly and interest rates would also ease accordingly
44 and find an economic rate for the general good.

45 MY FORMULA TO DETERMINE OUR PRESENT MONEY SUPPLY:

46 My Formula offers a simple yardstick to determine what the total amount of
47 our national money supply should be at the present time. As our national revenue from
48 our gross national product totalled some \$36 billions in the past year, and as less than
49 \$2 billions of this money still remains in the pockets of the general public, it's clear
50 that the balance of \$34 billions was duly deposited in the banks. All this money reached
51 the banks in the form of cash deposits and loan repayments, so that the banks are still
52 responsible for it all. After allowing \$16 billions to account for their investment hold-
53 ings, it's obvious that our deposits and loan repayments for the year provided the banks
54 with a money supply of \$18 billions.

Nethercut & Young

Toronto, Ontario

A1101

According to my Formula, this supply of money constitutes a national and banking monetary asset, and I therefor call upon the banks in the public interest to list this money supply in their statements as an asset, and to also list this amount of additional liabilities as owing to the customers from whom the money was taken without giving them offsetting compensation in return.

As the banks however, devalued their own monetary asset, they could alternately, report a cash deficit or cash overdraft on the asset side of their statements to offset their hidden profits or liabilities, instead of discarding their own assets to conceal their hidden liabilities or profits.

Hence, my Formula states that at the present time our national money supply should total \$18 billions more than the amounts reported by the governments and banks. This enlarged amount is equivalent to the gross amount of our national revenue after allowing for the amount of currency outstanding in the hands of the public and the amount of bank investment holdings. This is why I call for this national money supply to be listed by the banks as monetary assets, and this is why I call for the banks to issue credits thereagainst in favor of the government. This would enable the government to write off its deficits and provide for the payment of the public debt on maturity.

If this Formula were to be taken advantage of by the Government of the day, its so-called deficits or net debt would be replaced with bank balances, and would provide it with a \$6 billion cash surplus. Our banking assets would then total \$18 billions more than they do now and would thus provide the banks with sufficient assets to offset the corresponding increase in their deposit liabilities. This would put both the government and the banks in a sound and solvent condition. It would also provide the government and people of Canada with the additional capital they now so sorely need for their debt and operating requirements, and best of all it would provide this additional capital without further cost and without any increase in the public debt or taxation.

I beg to report that I have already advise the Government of my objection to its appointment of Mr. J. Douglas Gibson, the General Manager of the Bank of Nova Scotia, as a Commissioner to sit on the Commission because of my dispute with his bank and because of the part he has played therein regard. I strongly protest his sitting in judgement on our dispute, and I object to giving him the opportunity to attempt to brain-wash the other Commissioners in regard to my dispute with his bank, and the other matters set forth in my Brief.

This Submission is intended as a Supplement to my Brief of October 24th last, and is intended to form a part thereof and to be read accordingly.

My thanks go to you Commissioners in anticipation of a sincere consideration of my Brief and Supplement, and I look forward to a personal hearing thereon in due course to support my charges and findings.

In the meanwhile, I remain,

Sincerely,

(Frank O'Hearn)

59 Bethune Blvd.,
Scarboro, Ont.

AM 7-6054

According to my formula, this supply of money constitutes a national supply of money, and I therefore call upon the banks in the public interest to supply this money supply in their statements as an asset, and to also list the money as additional assets owing to the customers from whom the money was taken, not giving their existing compensation in return.

As the banks however, develop their own monetary assets, they could not report a cash deficit or cash assets off on the assets side of their statements, but instead of disclosing their own assets to the public, they would list their hidden liabilities or profits.

Hence, my formula states that at the present time our national money supply should total 7 billion more than the amount reported by the government and banks. This enlarged amount is equivalent to the gross amount of our national assets, allowing for the amount of currency outstanding in the hands of the public and the amount of bank investment holdings. This is why I call for this national money supply to be by the same as monetary assets, and this is why I call for the banks to make credit statements in favor of the government. This would enable the government to write its deficits and provide for the payment of the public debt on maturity.

If the formula were to be taken advantage of by the Government of Canada, no national deficits or net debt would be reported with bank liabilities, and would provide with a \$6 billion cash surplus. Our banking assets would then total \$16 billion more than they do now and would thus provide the banks with sufficient assets to cover the corresponding increase in their hidden liabilities. This would not only give the government and the banks in a sound and solvent condition, it would also provide the government and people of Canada with the additional capital they now so sorely need for debt and investing requirements, and best of all it would provide this additional debt without interest cost and without any increase in the public debt or taxation.

I beg to report that I have already advised the Government of my report on the appointment of Mr. L. Douglas Gibson, the General Manager of the Bank of Nova Scotia, as a Commissioner to report on the Commission because of my disagreement with him, and because of the fact that he has played a very important part in the judgment on our debt, and I object to having the Commission to attempt to do what the other Commission has in regard to the debt with the Bank and the other members of the Board.

This Commission is intended as a replacement to my report on October 1st, and is intended to form a part thereof and to be read accordingly.

My thanks go to you, for your interest in the Commission of a sincere country, and your support and equipment, and I look forward to a personal meeting with you in the future, and I hope to see you again and I hope to see you again.

In the meanwhile, I remain,

(Signed) C. J. (John)

Mr. J. H. (John)

Mr. J. H. (John)

SUBMISSION

to the

ROYAL COMMISSION

ON

BANKING AND FINANCE

*

by the

COMMUNIST PARTY OF CANADA

*

March 12, 1962
24 Cecil Street,
Toronto 2B, Ontario.

SUBMISSION OF THE COMMUNIST PARTY OF CANADA

to the

ROYAL COMMISSION ON BANKING AND FINANCE

Mr. Chairman and Members of the Commission:

Para. 1 The Commission has been asked to "inquire into and report on the structure and methods of operation of the Canadian financial system, including the banking and monetary system and the institutions and processes involved in the flow of funds through the capital market".

Para. 2 The ramifications of these systems, institutions and operations are complex and varied. They are a hodgepodge of government and private institutions, with the dominant credit and financial institutions completely in private hands. Each private corporation and financial institution pursues a policy which it considers to be most profitable, without regard to the overall national interest.

Para. 3 Because actual credit is under the control of private institutions, capital investments flow into those sectors of the economy which provide the greatest immediate returns. That is one reason why our mineral resources sector of the economy is over developed, while manufacturing industries are underdeveloped.

Para. 4 The money and credit system fundamentally is a function arising from the mode of production - the economic system, and its strength and stability cannot be separated from the economic system. While the direction, regulation and operation of the money and credit system is a direct responsibility of the Federal government, the organization, control and planning of production is not. This contradiction is acknowledged, by implication, in the provision for decennial reviews and appropriate revisions of the Bank Act to bring the banking and financial system into line with the needs and difficulties of production.

26
27
28
29
30

Para. 5 This contradiction was recognized also in 1935, when the Federal government was impelled by necessity to take away from the chartered banks the right to issue currency. But developments in industry, commerce, and finance during this century have been such that if the money and credit system, and the varied institutions through which it operates, are to serve the national interest, their responsibility should cover a very much wider field than is provided by the Bank Act or the Bank of Canada Act.

Para. 6 Financial policy reflects, and in turn affects, every facet of the economic life of Canada. The fact that the financial and banking system is, basically, an expression of production, leads to the conclusion that the primacy of production should be recognized in policy-making; anything that is physically possible in Canada is also financially possible. The purpose of financial policy should be to implement a growth of actual physical production of not less than 5% per year. The Federal Government should be provided with the necessary authority to be able effectively to use financial policy and the financial institutions of the country in order to achieve the objective of economic growth, with full employment.

Para. 7 We wish to bring to your attention the preamble of the Bank of Canada Act.

"An Act to Incorporate the Bank of Canada"

Para. 8 WHEREAS it is desirable to establish a central bank in Canada to regulate credit and currency in the best interests of the economic life of the nation, to control and protect the external value of the national monetary unit and to mitigate by its influence fluctuations in the general level of production, trade, prices and employment, so far as may be possible within the scope of monetary action, and generally to promote the economic and financial welfare of the Dominion:

THEREFORE, His Majesty, by and with the advice and consent of the Senate and House of Commons of Canada, enacts as follows:"

Para. 9 If the provisions of the Act were to embody the essence of its preamble, a good beginning would be made to "promote the economic and financial welfare" of Canada.

Para. 10 We emphasize that financial policy can be made fully effective only if the Bank of Canada becomes the head of a unified Canadian banking system, whose operations are integrated with the planned

development of industry, trade and commerce. The Communist Party of Canada contends that to achieve such a goal, nationalization of major industries (mainly U.S.-owned and -controlled industries) as well as banking and credit, is a prime necessity, for the following reasons:

Para. 11 a) Nationalization of the banking and credit system would make it possible to achieve a balanced economic development, based on the genuine industrialization of Canada - manufacturing of finished goods from our natural resources, our energy and our manpower, and the elimination of the condition in which manufacturing occupies a less important part of the economy than 10 years ago. This would reduce our dependence on the U.S.A. for a large part of our manufactures and for almost all our machinery and machine-tools.

Para. 12 b) Nationalization would make it possible to deal with the problem of uneven economic development particularly in the Maritimes and the Prairie Provinces.

Para. 13 c) Nationalization would help to reduce interest charges on loan capital, encourage capital investment in manufacturing, increase the rate of economic growth and stimulate employment. Lower interest rates would discourage the flow of foreign capital and thus reduce our dependence upon it.

Para. 14 d) Nationalization would ensure a much more efficient credit system.

Para. 15 e) Nationalization would eliminate the present superimposed absolute control by a small group of financiers over the production and distribution of goods.

Para. 16 Without a unified credit system and Federal government control of credit we cannot achieve a balanced economic development and mobilize the capital resources of Canada.

Para. 17 The control of credit by private institutions tends to increase the interest charges on loan capital and thus discourages capital investments in those sectors of the economy which are most urgently needed in the national interest. High interest rates attract foreign capital and so increase our dependence.

development of industry, trade and commerce. The Communist Party of Canada contends that to achieve such a goal, nationalization of major industries (mainly U.S.-owned and -controlled industries) as well as banking and credit, is a prime necessity, for the following reasons:

Para. 11 a) Nationalization of the banking and credit system would make it possible to achieve a balanced economic development based on the genuine industrialization of Canada - namely

facturing of finished goods from our natural resources, our energy and our manpower, and the elimination of the conditions in which manufacturing assumes a less important part of the economy than 10 years ago. This would reduce our dependence on the U.S.A. for a large part of our manufacturing and for almost all our machinery and machine-tools.

Para. 12 b) Nationalization would make it possible to deal with the problem of uneven economic development particularly in the Maritimes and the Prairie Provinces.

Para. 13 c) Nationalization would help to reduce interest charges and increase the rate of economic growth and stimulate employment. Lower interest rates would discourage the flow of foreign capital and thus reduce our dependence upon it.

Para. 14 d) Nationalization would ensure a much more efficient and system.

Para. 15 e) Nationalization would eliminate the present superposition of absolute control by a small group of financiers over the production and distribution of goods.

Para. 16 Without a unified credit system and national government control of credit we cannot achieve a balanced economic development and mobilize the capital resources of Canada.

Para. 17 The control of credit by private interests tends to increase the interest charges on loan capital and thus raises

most urgently needed in the national interest.

1
2
3 Para. 18 The present mixture of private and public credit institutions
4 is the most inefficient system. It superimposes on the process
5 of production an absolute control by a small group of private
6 financial institutions.

7 Para. 19 While the absence of a co-ordinated system of financial
8 credit hampers the growth of our economy, it is by no means
9 the only factor responsible. The fatalistic concept of the
10 inevitability of war has resulted in military expenditures
11 of about \$20 billion since the end of World War 2. This is
12 one-third more than the capital investment from all foreign
13 countries since the war. This policy has distorted our
14 economy, resulting in the over-production of raw materials
15 (uranium, lead, zinc, copper and the neglect of our manu-
16 facturing industries. This enormous expenditure was not only
17 socially wasted, but if only a part of it had been invested
18 in the Canadian economy it would have brought the most bene-
19 ficial results to the Canadian people.

20 Para. 20 The most important reason, however, for the stagnation and
21 distortion of our economy is the alarming growth of the control
22 and domination of the major sectors of our economy by U.S.
23 monopolies.

24 Para. 21 In the manufacturing industries (which are technically de-
25 pendent on the U.S. parent industries and are in effect branch
26 plants) control of U.S. residents increased from 39% in 1948
27 to 44% in 1958 and these in the main are the dominating monopoly
28 industries; in petroleum and natural gas in 1958 there was
29 69% U.S. control, while in mining and smelting this control
30 increased from 37 to 55 per cent. By 1959 of the 20.7 million
long term foreign investments in Canada 75% was U.S. investment.

Ever since 1949, when the plan for the integration of the
Canadian and U.S. economies (Abbott Plan) was introduced by
the Liberal Government, the Communist Party has warned that
the long-term effect of this would be a growing disproportion
in the Canadian economy, rising unemployment and greater loss
of our sovereignty.

Para. 22 The basis of this policy of "integration"; acceded to now

is the most inefficient system. It superimposes on the
of production an absolute control by a small group of
financial institutions.

While the absence of a co-ordinated system of financial
credit hampers the growth of our economy, it is by no means
the only factor responsible. The fatalistic concept of the
inevitability of war has resulted in military spending of
of about \$20 billion since the end of World War II. This is
one-third more than the capital investment from all foreign

economy, resulting in the over-investment of new materials:
uranium, lead, zinc, copper, and the deficit of our non-
ferrous industries. This enormous expenditure has not only
socially wasteful, but is only a part of it has been invested
in the Canadian economy. It would have brought the most satis-
fying results to the Canadian people.

The most important reason, however, for the stagnation and
distortion of our economy is the alarming growth of the con-
and domination of the major sectors of our economy by U.S.

18 para. 21 In the manufacturing industries (which are 70 per cent
dependent on the U.S. parent industries and are in a state of
control of U.S. residents increased from 10% in 1948
to 44% in 1958 and these in the main are the dominant mono-
poly; in petroleum and natural gas in 1958 the U.S. was
99% U.S. control, while in machine and smelting this control
increased from 37 to 55 per cent. By 1958 of the total in-
long term foreign investments in Canada 75% was U.S. invest-
ment since 1945, when the plan for the investment of U.S.
Canadian and U.S. economies (Lloyd Plan) was introduced by
the Liberal Government, the Dominion Party has worked for
the long-term effect of this would be a growing dependency
in the Canadian economy, rising unemployment and stagnation
of our sovereignty.

by Canadian governments for 14 years, was the assumption of the inevitability of war and the necessity for raw material development in Canada as a basis for the war industry of the U.S.

Para. 23 In 1952 President Eisenhower made clear U.S. policy as follows:

Para. 24 "From my viewpoint, foreign policy is, or should be, based primarily on one consideration. That consideration is the need for the United States to obtain certain raw materials to sustain its economy, and, where possible, to preserve profitable foreign markets for our surpluses." In the same year the Paley Report, which was a detailed study of the raw materials of the world in the light of U.S. needs declared that of 22 strategic materials, 10 were present in Canada.

Para. 25 In our brief to the Royal Commission on Canada's Economic Prospects in January, 1956, we stated:

Para. 26 "Our industrial development has not included that emphasis upon the production of the machinery of production - machine-tools, modern labor-saving machines, and a steel industry which takes care of Canadian needs, which constitute the very heart of an independent national economy. On the contrary, U.S. ownership and control of Canadian industry has reduced large sections of it to a parasitic existence in the sense that they are almost wholly dependent for their vital parts upon U.S. imports. Our industry, because of foreign control, is poorly developed in the basic dynamic sense of being able to produce its own means of production, and is dependent upon the U.S.A."

Para. 27 Developments since that time have only emphasized the same trend. In October, 1960, for example, Mr. James Coyne, then governor of the Bank of Canada, said in Calgary:

Para. 28 " 'No other nation so highly industrialized as Canada has such a large proportion of its industry controlled by non-resident companies,' to quote the restrained language of a Dominion Bureau of Statistics publication. I prefer to put understatement behind us and suggest that no country in the world with anything like our relative state of development has ever had such a degree of foreign domination, or even half or one-quarter the degree of foreign domination.

by Canadian governments for 14 years, was the assumption of the
inevitability of war and the necessity for new materials develop-
ment in Canada as a basis for the war industry of the U.S.
In 1942 President Eisenhower made clear U.S. policy as follows:
"From my viewpoint, foreign policy is, or should be, based
primarily on one consideration. That consideration is the need
for the United States to obtain certain raw materials to meet
its economy, and, where possible, to preserve profitable foreign
markets for our surplusage." In the same year the War Relocation
Authority was a detailed study of the raw materials of the world
in the light of U.S. needs during the war of 22 strategic
materials, 10 were present in Canada.
In our first to the Royal Commission on Canada's Economic
Prospects in January, 1956, we stated:
"Our industrial development has not included that emphasis
upon the production of the machinery of production - machines,
tools, modern labor-saving machines, and a steel industry which
takes care of Canadian needs, which constitutes the very heart
of an independent national economy. On the contrary, U.S.
ownership and control of Canadian industry has reduced large
sections of it to a parasitic existence in the sense that the
are almost wholly dependent for their vital parts upon U.S.
imports. Our industry, because of foreign control, is poorly
developed in the basic dynamic sense of energy and is unable to
its own means of production, and is dependent upon the U.S.
Developments since that time have only emphasized the same
trend. In October, 1950, for example, H. James says, "The
government of the Bank of Canada, and the Ministry
"The other action so highly industrialized as Canada has
such a large proportion of her industry controlled by non-
resident companies, to quote the Dominion Bureau of Statistics,
Dominion Bureau of Statistics publication, "I wonder to see
underestimation behind us and suggest that no country in the
has ever had such a degree of foreign domination, or even
or one-quarter the degree of foreign domination."

4 Para. 29 "By far the lion's share of the foreign control rests with
5 American companies, the growing predominance of which has been
6 a marked feature of our postwar history.

7 Para. 30 "Most Canadians would agree that the degree of foreign
8 domination, and especially American domination of Canadian
9 economic life has increased, is increasing, and ought to be
10 diminished."

11 Para. 31 To end the imbalance in the economy to ensure the all-round
12 development of Canada for its people, we would remind the
13 commission of another speech by Mr. James Coyne in Toronto
14 (November, 1960) in which he stated that a growth of population
15 and employment would require,

16 Para. 32 "a strong and active policy in the economic sphere on the
17 part of all levels of government. The operation of natural
18 forces along the 'policy of laissez-faire' will not cure our
19 troubles. The lead in such matters will naturally come from
20 the national government."

21 Para. 33 All of these factors taken together - private control of
22 money and credit, the fatalistic concept of the inevitability
23 of war, U.S. control and domination of the major sectors of
24 our economy - call for far-reaching measures. It is the con-
25 sidered opinion of the Communist Party that the nationalization
26 of the U.S.-owned and -controlled industries in Canada and
27 the nationalization of the credit system are the solutions to
28 the problem of economic growth in Canada.

29 Para. 34 The functions of the various forms of activity through which
30 the process of mobilizing, concentrating, and distributing the
financial resources of the country operates, are related so
intimately that nationalization of banking and credit requires
nationalization of the Chartered Banks, trust companies and
insurance companies, and their operation as a public service
under governmental direction and control, in co-ordination with
the government's policy on taxation and investment, all with
the aim of expanding the economy, redistributing the national
income by social welfare measures and managing the national
debt.

Para. 29 "By far the lion's share of the foreign control which has American companies, the growing predominance of which has

Para. 30 "Most Canadians would agree that the degree of foreign domination, and especially American domination of Canadian economic life has increased, is increasing, and ought to be diminished."

Para. 31 To end the imbalance in the economy so severe that a further development of Canada for its people, we would need the commission of another speech by Mr. James Coyne in Toronto (November, 1960) in which he stated that a growth of population and employment would require,

"A strong and active policy in the economic sphere on the part of all levels of government. The operation of natural forces along the 'law of laissez-faire' will not cure our troubles. The lead in such matters will naturally come from the national government."

Para. 32 All of these factors taken together - private control of money and credit, the fantastic concept of the 'free market' of war, U.S. control and domination of the major sectors of our economy - call for far-reaching measures. To the non-aligned opinion of the Communist Party that the nationalization of the U.S.-owned and -controlled industries in Canada is the nationalization of the credit system are the solutions to the problem of economic growth in Canada.

Para. 33 The functions of the various forms of activities through the process of mobilizing, concentrating, and distributing financial resources of the country operates, are not an isolated and nationalization of banking and credit system, nationalization of the chartered banks, other companies and insurance companies, and their operation as a public service under governmental direction and control, in co-operation with the government's policy on taxation and investment, all with the aim of expanding the economy, redistributing the national income by social welfare measures and ensuring the national debt.

Policies Leading Towards Effective National Coordination and Control of Canada's Financial Structure, in the Public Interest.

Para. 35 To say the levelling down of financial impediments to full employment and the increasing welfare of the Canadian people will be achieved only with full nationalization of the financial institutions, is not to deny that substantial improvements can come from an extension of public control and more effective public financial operations short of nationalization. We strongly support interim measures which will enhance the welfare of workers and their families in this as in other spheres of economic life. In fact, this is the touchstone for judging government policies -- do they contribute to the welfare of the majority of the people, or do they not?

Para. 36 It is from this point of view that we submit the various proposals which follow. Each one, we believe, will bring an improvement to the existing situation. Taken together, they should accelerate movement along the road towards better living standards and more social security for the Canadian people.

1. National Investment for Economic Expansion

Para. 37 The importance of national investment in stimulating economic activity is illustrated in the table below. (This table is based on figures from appendix A).

Para. 38 Investment is taken as the sum of expenditures on housing, government capital (excepting military), business fixed capital and inventory changes (from the D.B.S. "National Accounts").

Para. 39 Economic activity is measured by the D.B.S. Index of Industrial Production, the periods of contraction being those in Prof. Hood's report to the recent Senate Committee on Manpower.

Para. 40 The table shows that in the period immediately following declines in total investment, the economy slipped back generally.

 Policies Leading Towards Nationalization and

To say the leveling down of financial impediments to employment and the increasing welfare of the Canadian people will be achieved only with full nationalization of the financial institutions, is not to deny that substantial improvement can come from an extension of public control and more effective public financial operations apart from nationalization. It is from this point of view that we submit the various proposals which follow. Each one, we believe will bring an improvement to the existing situation. Taken together, they should accelerate movement along the road towards better living standards and more social security for the Canadian people.

It is from this point of view that we submit the various proposals which follow. Each one, we believe will bring an improvement to the existing situation. Taken together, they should accelerate movement along the road towards better living standards and more social security for the Canadian people.

National Investment for Economic Expansion
 The importance of national investment in stimulating economic activity is illustrated in the table below. (This table is based on figures from appendix A).

Investment is taken as the sum of expenditures on housing, government capital (excluding military), business fixed capital, and inventory changes (from the 1948 "National Accounts"). Economic activity is measured by the G.D.P. index of the industrial production, the periods of construction being those in Prof. Hood's report to the recent Senate Committee on National Development.

The table shows that in the period immediately following declines in total investment, the economy slipped back

------	---------------------

Para. 41 In order to sustain a rising standard of life and even the minimum of desirable opportunity for our sons and daughters, Canadians must insist upon governmental responsibility for maintaining the rate of investment at least a little higher than the rate of the growth of population. The characteristic post-war ups and downs of investment in Canada must be smoothed out. This can be done and financial policy should be directed to insuring it.

Para. 42 The aim of financial policy should be to see that the savings of the people are invested in the dynamic development of the country: its productive, transport and communication facilities, its domestic trade and foreign commerce, its stock of social facilities. It is a matter of grave concern to all Canadians that, in the absence of such a conscious policy, the production of goods in our country has not kept pace with the growth of population during recent years.

Para. 43 Indeed, the per-capita production of goods has actually declined, so that in 1960 it was \$54 per person less than in 1956.

Para. 44 This whole field of investment is so important to the welfare of all Canadians that we recommend the establishment of a Department of National Investment under a senior cabinet minister. This department might well combine the most of the present functions of the Department of Northern Affairs and National Resources and the Department of Public Works. The new Department of National Investment would then include such additional functions as--

- (a) long term investment planning to determine the needed scope, timing and location of public investment.
- (b) public investment in housing (expanded Central Mortgage and Housing Corporation)
- (c) public investment in resource and regional development projects (e.g. national power grid; hydro power on Columbia River in B.C., Hamilton River in Labrador;

uranium enrichment at remote power site; Chignecto Canal in New Brunswick, etc.)

- (d) public investment in new manufacturing where private investment fails to go (e.g. coal-based chemical industry in Maritimes; industrial components, like transistors, tightly controlled by foreign parent companies; steel industries (basic and fabricating) near ore sites); possibly the Industrial Development Bank should be put under this department.

- (e) public investment in social facilities (expanded public works, hospitals, schools, highways, roads, etc.)

Para. 45 The financing of such projects could be done by the sale of government bonds for miscellaneous small projects, and of bonds guaranteed by the government covering specific large projects (like the C.N.R.). Especially for self-liquidating projects like power developments, new manufacturing facilities, and so forth, the latter method should be used and the bonds gradually retired out of earnings.

Para. 46 Where such projects are individually administered by Crown Companies or Commissions, the limits of authority and responsibility must be clearly defined so that the resources of such corporations, including any profits, be clearly specified as publicly-owned property and used solely for the public good.

Para. 47 Crown Companies should not invest their surplus funds in foreign countries (like Polymer Corp. is reported to be doing in Belgium). Crown Corporations are the property of the Canadian people. Regardless of the motives which led to their establishment, accumulated profits are not the private affair of their appointed directors or of the cabinet minister on whose recommendation they were appointed. Such profits should be paid to the Receiver-General of Canada. To invest them in foreign countries, while Canada is in urgent need of investment capital, is a practice to be condemned and made impossible in the future, by law.

Canal in New Brunswick, etc.)

(b) public investment in new manufacturing where private investment fails to go (e.g., coal-based chemical in-

vestments, tightly controlled by foreign parent companies, steel industries (basic and fabrication) near sea ports possibly the Industrial Development Bank should be put

(e) public investment in social facilities (sewerage, public

Para. 45 The financing of such projects could be done by the sale of Government bonds for miscellaneous small projects, and of bonds guaranteed by the Government covering specific large projects (like the C.M.R.). Especially for self-liquidating projects like power development, new manufacturing facilities, and so forth, the latter method should be used and the bonds repaid out of earnings.

Para. 46 Where such projects are individually administered by Government Companies or Commissions, the limits of authority and responsibility must be clearly defined so that the responsibility of the corporations, including any profits, be clearly assigned and publicly-owned property and used solely for the public good.

Para. 47 Crown Companies should not invest their surplus funds in foreign countries (like Polymer Corp. is reported to be doing in Belgium). Crown Corporations are the property of the Canadian people. Regardless of the motives which led to the establishment, accomplished credits are not the private property of their appointed directors or of the cabinet. Ministers whose recommendation they were appointed, such as the Hon. J. G. Macdonald, be paid to the Receiver-General of Canada. The investment in foreign countries, while Canada is in urgent need of investment capital, is a practice to be condemned and made illegal in the future, by law.

Para. 48 As a further step to insure a national investment policy in the public interest there must be some public control over capital exports and the general direction of private capital investment in Canada.

Para. 49 First, since the major portion of funds administered by the financial institutions (banks, trust companies, insurance companies, pension trusts, etc.) are the savings of the community entrusted to them, at least 50 per cent of their assets should be required to be in the form of Dominion of Canada bonds. This will automatically assure a steady market for government bonds and provide substantial funds for carrying out public investment policies. It will also guarantee that at least half of the nation's savings are invested in worthwhile projects for the development of Canada.

Para. 50 Second, the federal government should have veto power over any large private investment (say over some specified amount, such as \$100 million) considered not to be in the public interest. A government, trying to protect the welfare of the people, for example, would not have allowed the unwarranted over-expansion of uranium mining, with its subsequent inevitable collapse and its attendant hardships for the people and communities directly involved.

Para. 51 Third, export of capital from Canada for long-term investment abroad should be subject to government licence granted solely on the basis of what is in the best interests of the Canadian people. This could effectively put a stop to the draining of needed capital out of Canada for investment abroad in enterprises exploiting other people to the detriment of the good name of Canada internationally.

2. Expansion of Purchasing Power in Stable Dollars

It is our contention, and the main thesis of this Statement, that national policy in respect to regulation of the money and credit system and the institutions that are involved in its operation, should be directed to maintain the purchasing power of the Canadian dollar at a stable level, while making available all the credit required for continuous expansion of the country's economy. This is matter of direct personal concern to the overwhelming majority of Canadians.

Para. 52 We do not assert that financial policy alone will insure continuous expansion of the national economy and a stable price

Para. 48 As a further step to insure a national investment policy in the public interest there must be some public control over capital exports and the general direction of private capital investment in Canada.

Para. 49 First, since the major portion of funds administered by the financial institutions (banks, trust companies, insurance companies, pension funds, etc.) and the savings of the country are entrusted to them, at least 50 per cent of their assets should be required to be in the form of Dominion of Canada bonds. This would automatically assure a steady market for government bonds and provide substantial funds for carrying out public investment policies. It will also guarantee that a large part of the nation's savings are invested in worthwhile projects for the development of Canada.

Para. 50 Second, the federal government should have veto power over any large private investment (say over some specified amount, such as \$100 million) considered not to be in the public interest. A government trying to protect the welfare of the people, for example, would not have allowed the unbridled over-expansion of uranium mining, with its subsequent inevitable collapse and its attendant hardship for the people and economy. It is necessary to invest.

Para. 51 Third, export of capital from Canada for long-term investment abroad should be controlled on the basis of what is in the public interest of the Canadian people. This could effectively be done by the government, which would need capital out of Canada for investment abroad in order to exploit other people to the detriment of the good of Canada internationally.

2. Expansion of investment in Canada
It is our contention, and the main basis of this report, that national policy in respect to regulation of the money and credit system and the institutions that are involved in the money and credit system should be directed to the benefit of the Canadian people, and not to the benefit of the foreign banks and credit institutions. This is a matter of direct personal concern to the Canadian people.

level, particularly in the long term; but we do consider that a central test of whether or not financial policy is aimed primarily to serve the real interests of the people is its influence upon the internal purchasing power of the nation's currency. The record is a sorry indictment of successive federal governments' financial policies:

In 25 years since 1936, the dollar fell to 47¢ of its former value.

In 16 years since 1945, the dollar fell to 58¢ of its former value.

In 10 years since 1951, the dollar fell to 88¢ of its former value.

In 5 years since 1956, the dollar fell to 91¢ of its former value.

Para. 53 This has obviously had drastic effects upon the lives of millions of Canadians who could least afford it.

There is much that the government can do to bring about
Para. 54 price stability -- maintenance of the real purchasing power of the dollar -- short of direct price control, as in wartime. For example, the government can:

- (a) stop expanding the currency faster than production (there are better ways of financing public investment than this, as we have recommended in the previous section)
- (b) cut unproductive military spending
- (c) hold down interest rates, instead of giving a lead to raising them, as in the 1958 bond conversion campaign. (In fact, this is a key element of financial policy, affecting many other facets of the economy. The high interest rates of recent years have added to the prices of all goods, stimulated additional unwanted foreign capital inflow and increased the burden of debt charges on this and future generations.)

Para. 55 Inseparable from protecting the people by maintaining a stable price level, is the need to protect them against usury. It is a shocking thing that at the present time the law permits money-lenders to collect as much as 24 per cent per annum

level, particularly in the long term; but we do consider this a central test of whether or not financial policy is aimed primarily to serve the real interests of the people in the influence upon the internal purchasing power of the national currency. The record as a sorry indictment of successive federal governments' financial policies:

In 25 years since 1930, the dollar fell to 47% of its former value.
 In 10 years since 1945, the dollar fell to 52% of its former value.
 In 10 years since 1950, the dollar fell to 58% of its former value.
 In 5 years since 1955, the dollar fell to 91% of its former value.

Para. 53 This has obviously had drastic effects upon the lives of millions of Canadians who could have avoided this.

There is much that the government can do to bring about price stability -- maintenance of the gold purchasing power of the dollar -- short of direct price controls, as in wartime. For example, the government can:

- (a) stop expanding the money supply faster than production (there are better ways of financing public investment than this, as we have recommended in the previous section)
- (b) cut unproductive military spending
- (c) hold down interest rates, instead of giving a free rein to raising them, as in the 1958 bond conversion campaign (In fact, this is a key element of financial policy, affecting many other facets of the economy. The high interest rates of recent years have added to the cost of all goods, stimulated additional unwanted foreign capital inflow and increased the burden of debt both on this and future generations.)

Para. 54 Inevitable from protecting the people by maintaining a stable price level, is the need to protect them against what is a shocking fact that at the present time the low price money-lenders to collect as much as 10 per cent per annum

on small loans. This must be stopped. Seven per cent should be the maximum amount of interest and financial charges in any one year and legislation should be enacted to make this limit effective.

Para. 56 Besides holding the dollar stable and curbing usury, we need to expand aggregate purchasing power to ensure a rising standard of living for a steadily increasing population. Eighty per cent of consumer expenditures are regularly based on the wages and salaries distributed. The first source of increased effective purchasing power, therefore, is to be found in an expanding wage fund. This can result only from increased and/or increased wages. The focal points for government action here are:

- (a) expanded employment in the investment sector
- (b) expanded employment in consumer goods industries, arising from expanded purchasing power
- (c) a realistic, country-wide, minimum wage law of \$1.25, to strengthen the floor under wage rates.

Para. 57 Social security is the other important field for government measures to assure steadily expanding consumer purchases. More adequate standards are badly needed in several social security measures, but especially in old-age pensions. These are still scandalously low, and it is precisely the old-age pensioners who have been hardest hit by the declining internal value of our dollar.

Para. 58 Where is the money to come from for increased social security and like government expenditures? We submit that there are substantial untapped sources of tax revenue which can provide the necessary funds -- for example, capital gains and windfall profits which are still an untaxed element increasing wealth in the hands of the rich in Canada, and reduced arms expenditures.

3. Assistance to Municipalities in Financing

Para. 59 Canadian municipalities are hard pressed to meet the continually increasing demands for local improvements, education, welfare and other local services. Property taxes is the main

source of municipal funds, and this system places an impossibly heavy burden on small home-owners.

Para. 60 Municipal borrowing has been resorted to on a very large scale in recent years. In the fifteen post-war years 1946-1960, the total municipal debt increased from \$868 million to \$4,277 - a fourfold increase. Further, nearly \$1 billion of the 1960 total were foreign-pay securities as a consequence of the municipalities borrowing heavily in the United States. Not only does continued foreign borrowing pyramid the annual interest total going out of the country, but presumably the principal itself will have to be repaid, someday.

Para. 61 To stop foreign borrowing by Canadian municipalities and to assist them to obtain the cheapest money available in Canada, we recommend the establishment of a federal Municipal Loan Board to assist the municipalities to raise funds in Canada by providing federal government guarantees to approved issues of municipal bonds. The Municipal Loan Board could be organized as a subsidiary of the Bank of Canada, similar to the Industrial Development Bank; or the Board could come directly under the Minister of Finance.

Para. 62 To the extent that municipal bonds were not defaulted, the guarantee would cost the federal government nothing. But it would substantially cheapen the cost of borrowed money to the municipalities -- especially if the federal government energetically promotes low interest rates. This method of federal guarantee has been widely applied in C.M.H.C. housing loans. In this field it has had some effect in protecting small home-owners from exorbitant mortgage interest. Why cannot the same sort of federal assistance be afforded the hard pressed municipalities?

4. Farm Credits

Para. 63 Various elements of federal financial assistance to farmers are now grouped under the Department of Agriculture -- e.g. Farm Credit Corp., Agricultural Stabilization Board, Prairie Farm Assistance Administration. But an important part of the machinery for assisting farms -- the Farm Improvement Loans

source of municipal funds, and this system places an unusual heavy burden on small home-owners.

Municipal borrowing has been resorted to on a very large scale in recent years. In the fifteen years from 1925 to 1940 the total municipal debt increased from \$250 million to \$4,277 - a fourfold increase. Further, nearly \$1 billion of the 1940 total was borrowed in the form of bonds, and the municipalities borrowing heavily in the United States only does not need foreign borrowing. It is not only the recent total rising out of the country, but growing by the principal itself will have to be repaid, however.

2 Para. 60

To stop foreign borrowing by Canadian municipalities and assist them to obtain the cheapest money available in Canada we recommend the establishment of a Federal Municipal Loan Board to assist the municipalities to raise funds in Canada.

11 Para. 61

municipal bonds. The Municipal Loan Board could be organized as a subsidiary of the Bank of Canada, situated in the same Development Bank; or the Board could come under the

16 Para. 62

To the extent that municipal bonds were not repaid, would substantially cheapen the cost of borrowing money for municipalities -- especially if the federal government were to guarantee has been already applied in 1934. The federal government in this field is now being asked to consider what can be done to encourage the existing mortgage market. The federal government is already the largest lender of federal assistance to the farm mortgage market.

25 Para. 63

Various elements of federal financial assistance to farm are now grouped under the Department of Agriculture -- and Farm Credit Corp., Agricultural Development Bank, Farm Home Assistance Administration. But an important part of the machinery for assisting farms -- the farm improvement bank

4. Farm Credits

1
2
3 Act -- remains under the Department of Finance. We do not see
4 why this Act is not administered by a Board under the Department
of Agriculture.

5 Para. 64 As presently constituted, the Farm Improvement Loans Act
6 merely guarantees the private banks against losses up to a
7 total of 10 per cent on all the loans they make to farmers.
8 The total of all loans that can be insured under the Act at
9 any one time is \$300 million. Calls on the federal government
10 to make good on defaulted loans have been negligible, so the
11 Act has operated practically without cost to the government.
12 It is quite obvious, therefore, that the Act does not go
13 nearly far enough in providing financial help to farmers to
14 purchase implements, livestock, or pay for construction and
development work. Either the federal guarantee should be
raised substantially to encourage the banks to be more lenient
in the granting of these loans, or the government should make
them directly to the farmers.

15 5. Facilitating Foreign Trade

16 Para. 65 Federal responsibility for assisting export trade has already
17 been recognized with the setting up of the Export Credits
18 Insurance Corporation under the Department of Trade and Commerce.
19 The E.C.I.C.'s functions are being expanded somewhat with the
20 provisions for guaranteeing of credits and purchase of foreign
21 obligations up to \$300 million. This is all right as far as
22 it goes, but it is not nearly far enough and will not seriously
23 help our worsening trade crisis. The E.C.I.C.'s function is
only insurance of loans made by private financial institutions
or the exporter himself. It is not intended to extend needed
credit to a foreign country wishing to buy in Canada and repay
over a period of years.

24 Para. 66 We recommend that an Export-Import Bank be established, under
25 the Department of Trade and Commerce. Its functions would en-
26 compass three important kinds of assistance to Canada's foreign
trade.

27 Para. 67 1. Export Credits: The biggest lack now is for long-term loans
28 (5 to 15 years) to foreign countries wishing to buy capital
29

Act -- remains under the Department of Finance. We do not see why this Act is not administered by a Board under the Department of Agriculture.

As presently constituted, the Farm Improvement Loans Act merely guarantees the private banks against losses up to a total of 10 per cent on all the loans they make to farmers. The total of all loans that can be insured under the Act at any one time is \$300 million. Calls on the Federal Government to make good on defaulted loans have been negligible, so the Act has operated practically without cost to the Government. It is quite obvious, therefore, that the Act does not do nearly far enough in providing financial help to farmers to purchase implements, livestock, or pay for construction and development work. Either the federal guarantee should be raised substantially to encourage the banks to be more lenient in the granting of these loans, or the Government should make them directly to the farmers.

5. Facilitating Foreign Trade

Federal responsibility for assisting export trade has almost been recognized with the setting up of the Export Credits Insurance Corporation under the Department of Trade and Commerce. The E.C.I.C.'s functions are being expanded and with the provisions for guaranteeing of credits and purchase of foreign obligations up to \$300 million. This is all right as far as it goes, but it is not nearly far enough and will not do much to help our worsening trade crisis. The E.C.I.C.'s function is only insurance of loans made by private financial institutions or the exporter himself. It is not intended to extend new credit to a foreign country wishing to pay in Canada and repay over a period of years.

We recommend that an Export-Import Bank be established, with the Department of Trade and Commerce. Its function would be to compass three important kinds of assistance to Canada's foreign trade.

The biggest lack now is the long-term (5 to 15 years) to foreign countries wishing to buy capital

goods in Canada at low interest rates, say 3%. Other exporting countries have such export credit machinery and Canada is closing the door on export trade in machinery, etc. by its lack here. A second element of export credit which the Export-Import Bank should undertake is the holding of foreign currencies, where the importing country cannot pay immediately in "hard" currency. An exporter to India, for example, might be able to sell for rupees but not for Canadian dollars or sterling. In this case the Export-Import Bank would agree beforehand to accept the rupees from the exporters, and pay him in Canadian dollars -- in effect making a loan to India covered by rupees until the latter could be used up.

Para.68 2. Import Credits: This is a side of trade financing not now touched by the Canadian government. But it could open up avenues for expanding our export trade to countries with useful goods to sell and no contracts with Canadian importers. For example, under the Canadian-Soviet trade agreement Canadian exports could be increased in the ratio of 2 to 1 against our increased imports of Soviet goods. A means for directly expanding such import volume could be provided by the Export-Import Bank contracting for bulk purchases from the Soviet trading organizations, arranging for shipment to Canada and selling them to Canadian distributors. Besides locating the goods, the Bank will in effect be extending credit to the distributor until the goods reached him. Such techniques could be applied anywhere new sources of useful goods abroad were discovered with the two-way trade implication of expanding our exports.

Para.69 3. Foreign Exchange Rate: A third element in facilitating foreign trade is the exchange rate. Operation of the exchange fund might possibly be left to the Bank of Canada. But the object should be to maintain the external value of our dollar at the most appropriate level for both sides of our foreign trade and for internal price and employment policies. At best this level is a compromise that should be made consciously by the country concerned -- not by the blind force of external economic pressures.

General Conclusions.

Para. 70 The division of the social product between present consumption and investment for future benefit, is basic to the welfare of the people of every country. Of course, there are many factors which intervene between this prime cause and ultimate effect, to condition the general level of prosperity and that of particular sectors. But this decision as to the appropriate division of the social product is far too fundamental to be left entirely to chance.

Para. 71 Recognition of this fact is implicit in the now quite common proposals for cyclical budgeting, expanded public works in times of economic depression, etc. In our opinion, such proposals usually touch only the fringes of the problem. We believe that the more the conscious economic planning by central authority in the public interest, made possible by the nationalization of basic industries and the credit system, the better the ultimate results. To this end we propose an important extension of federal government activity in planning, controlling and carrying out national investment. Of course we recognize that the existing economic system places limitations on such activities, but such limits are themselves somewhat elastic and they have certainly not yet been stretched in Canada.

Para. 72 In our opinion, much can be done now, with the existing government agencies to curb monopoly and place it under greater public control.

SUMMARY

SUBMISSION OF THE COMMUNIST PARTY OF CANADA

to the

ROYAL COMMISSION ON BANKING AND FINANCE

The money and credit system fundamentally is a function arising from the mode of production - the economic system, and its strength and stability cannot be separated from the economic system. While the direction, regulation and operation of the money and credit system is a direct responsibility of the Federal government, the organization, control and planning of production is not.

The purpose of financial policy should be to implement a growth of actual physical production of not less than 5% per year. The Federal Government should be provided with the necessary authority to be able effectively to use financial policy and the financial institutions of the country in order to achieve the objective of economic growth, with full employment.

The Communist Party of Canada contends that to achieve such a goal, nationalization of major industries (mainly U.S.-owned and -controlled industries) as well as banking and credit, is a prime necessity, for the following reasons:

- a) Nationalization of the banking and credit system would make it possible to achieve a balanced economic development.
- b) Nationalization would make it possible to deal with the problem of uneven economic development particularly in the Maritimes and the Prairie Provinces.
- c) Nationalization would help to reduce interest charges on loan capital, encourage capital investment in manufacturing, increase the rate of economic growth and stimulate employment.
- d) Nationalization would ensure a much more efficient credit system.
- e) Nationalization would eliminate the present superimposed absolute control by a small group of financiers over the production and distribution of goods.

While the absence of a co-ordinated system of financial credit hampers the growth of our economy, it is by no means the only factor responsible. The fatalistic concept of the inevitability of war has

SUBMISSION OF THE COMMUNIST PARTY OF CANADA

to the

ROYAL COMMISSION ON BANKING AND FINANCE

The money and credit system fundamentally is a function arising from the mode of production - the economic system, and its strength and stability cannot be separated from the economic system. While the direction, regulation and operation of the money and credit system is a direct responsibility of the Federal Government, the organization and planning of production is not.

The purpose of financial policy should be to implement a growth of actual physical production of not less than 5% per year. The Federal Government should be provided with the necessary authority to be able effectively to use financial policy and the financial institutions of the country in order to achieve the objectives of economic development.

The Communist Party of Canada contends that to achieve such a goal nationalization of major industries (mainly U.S.-owned and -controlled industries) as well as banking and credit, is a prime necessity. To the following reasons:

- a) Nationalization of the banking and credit system would make it possible to achieve a balanced economic development.
- b) Nationalization would make it possible to deal with the problem of uneven economic development particularly in the Maritime provinces.
- c) Nationalization would help to reduce interest charges on loans, encourage capital investment in manufacturing, mining, and the rate of economic growth and stimulate employment.
- d) Nationalization would ensure a much more efficient credit system.
- e) Nationalization would eliminate the present superimposed control by a small group of financiers over the production and distribution of goods.

While the absence of a co-ordinated system of financial credit hampers the growth of our economy, it is by no means the only factor responsible. The fatalistic concept of the inevitability of war is

1
2
3
4 resulted in military expenditures of about \$20 billion since the
5 end of World War 2. This is one-third more than the capital invest-
6 ment from all foreign countries since the war. This policy has dis-
7 tortured our economy, resulting in the over-production of raw materials
8 (uranium, lead, zinc, copper) and the neglect of our manufacturing
9 industries. This enormous expenditure was not only socially wasted,
10 but if only a part of it had been invested in the Canadian economy
11 it would have brought the most beneficial results to the Canadian
12 people.

13 The most important reason, however, for the stagnation and dis-
14 tortion of our economy is the alarming growth of the control and dom-
15 ination of the major sectors of our economy by U.S. monopolies.

16 It is the considered opinion of the Communist Party that the
17 nationalization of the U.S.-owned and -controlled industries in Canada
18 and the nationalization of the credit system, are the solutions to
19 the problem of economic growth in Canada.

20 The functions of the various forms of activity through which the
21 process of mobilizing, concentrating distributing the financial re-
22 sources of the country operates, are related so intimately that
23 nationalization of banking and credit requires nationalization of
24 Chartered Banks, trust companies and insurance companies, and
25 their operation as a public service under governmental direction and
26 control, in co-ordination with the government's policy on taxation
27 and investment, all with the aim of expanding the economy, redis-
28 tributing the national income by social welfare measures and managing
29 of the national debt.

30 We strongly support interim measures which will enhance the wel-
fare of workers and their families, in this as in other spheres of
economic life. In fact, this is the touchstone for judging govern-
ment policies -- do they contribute to the welfare of the majority of
the people, or do they not?

In order to sustain a rising standard of life and even the minimum
of desirable opportunity for our sons and daughters, Canadians must
insist upon governmental responsibility for maintaining the rate of
investment at least a little higher than the rate of growth of pop-
ulation. The characteristic postwar ups and downs of investment

1
2
3 must be smoothed out. This can be done and financial policy should
4 be directed to insuring it.

5 This whole field of investment is so important to the welfare of
6 all Canadians that we recommend the establishment of a Department
7 of National Investment under a senior cabinet minister.

8 * * * *

9 There must be some public control over capital exports and the
10 general direction of private capital investment in Canada. First,
11 since the major portion of funds administered by the financial in-
12 stitutions are the savings of the community entrusted to them, at
13 least 50 per cent of their assets should be required to be in the
14 form of Dominion of Canada bonds. Second, the federal government should
15 have veto power over any large private investment (say over some
16 specified amount, such as \$100 million) considered not to be in the
17 public interest. Third, the federal government should prohibit the
18 export of capital from Canada for long-term investment abroad, in
19 enterprises exploiting other people.

20 * * * *

21 It is our contention that national policy in respect to regulation
22 of the money and credit system and the institutions that are involved
23 in its operation, should be directed to maintain the purchasing power
24 of the Canadian dollar at a stable level, while making available all
25 the credit required for continuous expansion of the country's economy.

26 Inseparable from protecting the people by maintaining a stable
27 price level, is the need to protect them against usury. Seven per
28 cent should be the maximum amount of interest and financial charges
29 in any one year and legislation should be enacted to make this limit
30 effective.

31 We need to expand aggregate purchasing power to ensure a rising
32 standard of living for a steadily increasing population. The first
33 source of increased effective purchasing power, therefore, is to be
34 found in an expanding wage fund. This can result only from increased
35 employment and/or increased wages.

36 Social security is the other important field for government measures
37 to assure steadily expanding consumer purchases. More adequate standards
38 are badly needed in several social security measures, but especially
39
40

must be smoothed out. This can be done and financial policy should be directed to insuring it.

This whole field of investment is so important to the welfare of all Canadians that we recommend the establishment of a Department of Investment.

* * *

There must be some public control over capital exports and the general direction of private capital investment in Canada. First, since the major portion of funds administered by the Government is derived from the savings of the community collected in taxes, at least 50 per cent of their assets should be required to be in the form of Dominion of Canada bonds. Second, the Government should have veto power over any large private investment (say over a specified amount, such as \$100 million) considered not to be in the public interest. Third, the Federal Government should prohibit the export of capital from Canada for long-term investment abroad, in enterprises exploiting other peoples.

* * *

It is our conviction that national policy is required to regulate the money and credit system and the institutions that are involved in its operation, should be directed to maintain the purchasing power of the Canadian dollar at a stable level, while making available the credit required for continuous expansion of the country's economy. Inasmuch as protection of the people by restriction of currency price level, is the need to protect them against unemployment, it should be the maximum amount of interest and demand deposits in any one year and legislation should be enacted to make this limit.

We need to expand aggregate purchasing power to create a rising standard of living for a steadily increasing population. The first source of increased effective purchasing power, therefore, is to be found in an expanding wage fund. This can be built only from increased employment and/or increased wages.

Secondly, it is the other important field for government action to assure steadily expanding consumer purchases. There should be no are badly needed in several social security measures, but several of

1
2
3 in old-age pensions.

4 We submit that there are substantial untapped sources of tax revenue which can provide the necessary funds -- for example, capital
5 gains and windfall profits which are still an untaxed element in-
6 creasing wealth in the hands of the rich in Canada, and reduced arms
7 expenditures.

8 * * * *

9 Canadian municipalities are hard pressed to meet the continually
10 increasing demands for local improvements, education, welfare and
11 other local services. Property taxes is the main source of municipal
12 funds, and this system places an impossibly heavy burden on small
13 home-owners.

14 To stop foreign borrowing by Canadian municipalities and to assist
15 them to obtain the cheapest money available in Canada, we recommend
16 the establishment of a federal Municipal Loan Board to assist the
17 municipalities to raise funds in Canada by providing federal govern-
18 ment guarantees to approved issues of municipal bonds.

19 * * * *

20 We recommend that an Export-Import Bank be established, under the
21 Department of Trade and Commerce. Its functions would encompass
22 three important kinds of assistance to Canada's foreign trade: export
23 credits, import credits, foreign exchange rate.

24 * * * *

25 As presently constituted, the Farm Improvement Loan Act merely
26 guarantees the private banks against losses up to a total of 10 per
27 cent on all the loans they make to farmers. The total of all loans
28 that can be insured under the Act at any one time is \$300 million.
29 The federal guarantee should be raised substantially to encourage the
30 banks to be more lenient in the granting of these loans, or the govern-
ment should make them directly to the farmers.

31 We believe that the more the conscious economic planning by
32 central authority in the public interest, made possible by the nation-
33 alization of basic industries and the credit system, the better the
